                     /clone_lib="UI-E-EO1"
                     /note="Organ: eye; Vector: pT7T3-Pac (Pharmacia) with a
                     modified polylinker; Site_1: EcoR I; Site_2: Not I;
                     UI-E-EO1 is a normalized cDNA library containing the
                     following tissue(s): fetal eye. The library was
                     constructed according to Bonaldo, Lennon and Soares,
                     Genome Research, 6:791-806, 1996. First strand cDNA
                     synthesis was primed with an oligo-dT primer containing a
                     Not I site. Double stranded cDNA was ligated to an EcoR I
                     adaptor, digested with Not I, and cloned directionally
                     into pT7T3-Pac vector. The oligonucleotide used to prime
                     the synthesis of first-strand cDNA contains a library tag
                     sequence that is located between the Not I site and the
                     (dT)18 tail. The sequence tag for this library is
                     CGCGTATACC. This library was created for the program, Gene
                     Discovery in the Visual System, supported by National Eye
                     Institute (NEI)."

                      a modified polylinker; Site_1: EcoR I; Site_2: Not I;
                      NCI_CGAP_Pl6 is a subtracted cDNA library constructed
                      according to Bonaldo, Lennon and Soares, Genome Research,
                      6:791-806, 1996. First strand cDNA synthesis was primed
                      with an oligo-dT primer containing a Not I site. Double
                      stranded cDNA was ligated to an EcoR I adaptor, digested
                      with Not I, and cloned directionally into pT7T3-Pac
                      vector. The oligonucleotide used to prime the synthesis of
                      first-strand cDNA contains a library tag sequence that is
                      located between the Not I site and the (dT)18 tail. The
                      sequence tags for this library are GA, AGGAA. For
                      additional information, contact: Bento Soares,

# SCORE OVER LENGTH SEARCHES

Attached is a score over length search. This search was developed to overcome limitations in most standard search systems which favor large sequences with high scoring, but lesser overall identity over smaller sequences with higher overall identity. This search is especially useful for relatively small nucleic acid or polypeptide target sequences (antisense, fragments, probes, primers, RNAi, epitopes, haptens, etc.) claimed functionally via a form of hybridization and/or identity language and having defined upper and lower polynucleotide and or polypeptide length limits.

The score over length search is performed by first running the query sequence using examiner-specified identity and polynucleotide or protein length limit parameters, and saving 65,000 hits and 0 alignments from each desired database. The resulting output is reformatted using a Microsoft Word macro and is imported into Excel. The summary table data are then sorted by the ratio of score of each hit sequence divided by its length and the accession numbers for all hits below the examiner's desired score over length parameters are deleted. The remaining accession numbers are used to pull the corresponding sequences from the databases into subdatabases enriched for good hits and the query sequence is re-run against these subdatabases to yield the final results.

The score over length cutoff for this search is 80%, length 30 - 2527 aa

Examiner Please Note: This cover sheet should be included when submitting results to be scanned.

No suitable results were found in PIR. No results from PIR included here.

XX
PI   Beseme F,  Blond J,  Bouton O,  Mandrand B,  Mallet F;
XX
DR   WPI; 1999-120897/10.
XX
PT   New nucleic acid sequences from human endogenous retrovirus-W - expressed
PT   exclusively in placenta and useful in diagnosis and therapy of autoimmune
PT   disease, and abnormal or failed pregnancy.
XX
PS   Claim 1; Page 71-74; 106pp; French.
XX
CC   This sequence represents the complete sequence of the human endogenous
CC   retrovirus (HERV) W genome. The nucleic acids, their fragments or
CC   peptides encoded by them are markers of autoimmune disease (e.g. multiple
CC   sclerosis, rheumatoid polyarthritis, disseminated lupus erythematosus,
CC   insulin- dependent diabetes and related pathologies) and of abnormal or
CC   unsuccessful pregnancy and can be used as chromosomal markers for
CC   susceptibility to these conditions, or proximity markers of genes
CC   associated with this susceptibility
XX
SQ   Sequence 7582 BP; 2156 A; 1877 C; 1537 G; 1796 T; 2 U; 214 Other;

  Query Match             99.9%;  Score 7487.42;  DB 1;  Length 7582;

PT   New isolated polynucleotide and encoded polypeptides, useful in
PT   diagnostics, forensics, gene mapping, identification of mutations
PT   responsible for genetic disorders or other traits and to assess
PT   biodiversity.
XX
PS   Claim 1; SEQ ID NO 12279; 103pp; English.
XX
CC   The invention relates to isolated polynucleotide (I) and polypeptide (II)
CC   sequences. (I) is useful as hybridisation probes, polymerase chain
CC   reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
CC   and in recombinant production of (II). The polynucleotides are also used
CC   in diagnostics as expressed sequence tags for identifying expressed
CC   genes. (I) is useful in gene therapy techniques to restore normal
CC   activity of (II) or to treat disease states involving (II). (II) is
CC   useful for generating antibodies against it, detecting or quantitating a
CC   polypeptide in tissue, as molecular weight markers and as a food
CC   supplement. (II) and its binding partners are useful in medical imaging
CC   of sites expressing (II). (I) and (II) are useful for treating disorders
CC   involving aberrant protein expression or biological activity. The
CC   polypeptide and polynucleotide sequences have applications in
CC   diagnostics, forensics, gene mapping, identification of mutations
CC   responsible for genetic disorders or other traits to assess biodiversity
CC   and to produce other types of data and products dependent on DNA and
CC   amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
CC   coding sequences of the invention. Note: The sequence data for this
CC   patent did not appear in the printed specification, but was obtained in
CC   electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PT  New polynucleotides, useful for expressing recombinant proteins for
PT  analysis, characterization or therapeutic use, or as markers for tissues
PT  in which the corresponding protein is preferentially expressed.
XX
PS  Disclosure; SEQ ID NO 2131; 1177pp; English.
XX
CC  The invention comprises the amino acid and coding sequences of novel
CC  proteins. The DNA and protein sequences of the invention are useful as:
CC  markers for tissues in which the corresponding protein is preferentially
CC  expressed; as molecular weight markers on gels; as chromosome markers or
CC  tags; to identify chromosomes or to map related gene positions; and to
CC  compare with endogenous DNA sequences in patients to identify potential
CC  genetic disorders. The present DNA sequence was used in the
CC  exemplification of the invention.

XX
PT Identifying a compound for treating a subject with or at risk of
PT developing preeclampsia, comprises determining whether the expression or
PT activity of syncytin in the cell is modulated in the presence of a test
PT compound.
XX
PS Disclosure; Page 39-42; 43pp; English.
XX
CC The invention relates to identifying compounds which are modulators of
CC syncytin expression. The syncytin modulators are useful in diagnosis and
CC treatment of preeclampsia and gestational trophoblast disorders (e.g.
CC choriocarcinoma, hydatiform mole, placental site tumour and missed/
CC incomplete abortion). Syncytin is a human gene derived from the envelope

```
CC   gene of human endogenous defective retrovirus, HERV-W. The present
CC   invention is based partly on the discovery that syncytin expression is
CC   dramatically reduced in preeclampsia, and is also mis-localised to the
CC   apical syncytiotrophoblast membrane. The present sequence is human
CC   syncytin cDNA

PT   New polynucleotides encoding secreted proteins.
XX
PS   Claim 13a; Page 100-101; 142pp; English.
XX
CC   This invention describes novel human secreted proteins encoded by
CC   polynucleotides isolated from human adult testes, adult brain, adult
CC   blood or adult placenta, or murine adult bone marrow or thymus cDNA
CC   libraries. The products of the invention are predicted to have biological
CC   activities which would make them suitable for treating, preventing or
CC   ameliorating medical conditions in humans and animals, although no
CC   supporting data is given. Suggested activities include nutritional
CC   activity, cytokine and cell proliferation/differentiation activity,
CC   immune stimulating (e.g. as vaccines) or suppressing activity,
CC   haematopoiesis regulating activity, tissue growth activity,
CC   activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic
CC   and thrombolytic activity, receptor/ligand activity, anti-inflammatory
CC   activity, cadherin/tumour invasion suppressor activity, and tumour
CC   inhibition activity. The polynucleotides are also stated to be useful for
CC   gene therapy

PT   New polynucleotides encoding secreted cDNA libraries, used to develop
PT   products for the diagnosis and treatment of neoplastic disease.
XX
PS   Claim 14; Page 107-108; 149pp; English.
XX
CC   This is the human secreted protein AJ172_2 nucleotide sequence, obtained
CC   from a human adult testes cDNA library. The invention relates to secreted
CC   human and murine proteins. The polynucleotides and proteins are predicted
CC   to have biological activities which would make them suitable for
CC   treating, preventing or ameliorating medical conditions in humans and
CC   animals. Detection of the levels of the proteins can be used for the
CC   diagnosis of e.g. pre-eclampsia, placental pathology or cancer. Agents
CC   which modulate the expression or function of the proteins may be used for
CC   treating a neoplastic disease and inhibiting metastasis. Other suggested
CC   activities include nutritional activity (e.g. in feeds), cytokine and
CC   cell proliferation/differentiation activity, immune stimulating (e.g. as
CC   vaccines) or suppressing activity, haematopoiesis regulating activity,
CC   tissue growth activity, activin/inhibin activity,
CC   chemotactic/chemokinetic activity, haemostatic and thrombolytic activity,
CC   receptor/ligand activity, anti-inflammatory activity, cadherin/tumour
CC   invasion suppressor activity, and tumour inhibition activity. The
CC   polynucleotide sequences are also stated to be useful for gene therapy

PT   Proteins AZ3021 encoded by clone AZ3021 from human adult colon, and
PT   BD12716 encoded by clone BD12716 from human fetal kidney cDNA library,
PT   useful for treating e.g. multiple sclerosis and rheumatoid arthritis.
XX
PS   Disclosure; SEQ ID NO 134; 412pp; English.
XX
CC   The invention relates to a protein comprising fully defined AZ302 1
CC   protein or BD127 1 6 protein. The polynucleotides are useful for
CC   expressing recombinant proteins for analysis and are also useful as
CC   chromosome markers or tags to identify chromosomes or to map related gene
CC   positions. The proteins are useful as amino acid supplement, carbon
CC   source, nitrogen source and carbohydrate source. The proteins are useful
CC   for treating various immune deficiencies and disorders (e.g. severe
CC   combined immunodeficiency (SCID)), autoimmune disorders (e.g. multiple
CC   sclerosis, systemic lupus erythematosus, rheumatoid arthritis), allergic
CC   reactions (e.g. asthma), myeloid or lymphoid cell deficiencies,
CC   osteoporosis or osteoarthritis, peripheral nervous system diseases (e.g.
CC   peripheral neuropathy, Alzheimer's disease, Parkinson's disease),
CC   coagulation disorders, inflammatory diseases (e.g. systemic inflammatory
CC   response syndrome (SIRS), ischaemia-reperfusion injury, Crohn's disease),
CC   anaphylaxis and hypersensitivity. Proteins are also useful for inducing
CC   tumour immunity, for inducing bone, cartilage, tendon, ligament and/or
CC   nerve growth or regeneration, for proliferating neural cells and for
CC   regenerating nerve and brain tissue, for inducing fertility and for
CC   inhibiting tumour growth. Proteins are also useful as chemokine for
CC   mammalian cells (e.g., monocytes, fibroblasts, neutrophils), and also
CC   useful as inhibitors of receptor/ligand interactions. The present
CC   sequence represents cDNA encoding a human secreted protein.

PT   New isolated polynucleotide and encoded polypeptides, useful in
PT   diagnostics, forensics, gene mapping, identification of mutations
PT   responsible for genetic disorders or other traits and to assess
PT   biodiversity.
XX
PS   Claim 1; SEQ ID NO 7531; 103pp; English.
XX
CC   The invention relates to isolated polynucleotide (I) and polypeptide (II)
CC   sequences. (I) is useful as hybridisation probes, polymerase chain
CC   reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
CC   and in recombinant production of (II). The polynucleotides are also used
CC   in diagnostics as expressed sequence tags for identifying expressed
CC   genes. (I) is useful in gene therapy techniques to restore normal
CC   activity of (II) or to treat disease states involving (II). (II) is
CC   useful for generating antibodies against it, detecting or quantitating a
CC   polypeptide in tissue, as molecular weight markers and as a food
CC   supplement. (II) and its binding partners are useful in medical imaging
CC   of sites expressing (II). (I) and (II) are useful for treating disorders
CC   involving aberrant protein expression or biological activity. The
CC   polypeptide and polynucleotide sequences have applications in
CC   diagnostics, forensics, gene mapping, identification of mutations
CC   responsible for genetic disorders or other traits to assess biodiversity
CC   and to produce other types of data and products dependent on DNA and
CC   amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
CC   coding sequences of the invention. Note: The sequence data for this
CC   patent did not appear in the printed specification, but was obtained in
CC   electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PT exclusively in placenta and useful in diagnosis and therapy of autoimmune
PT disease, and abnormal or failed pregnancy.
XX
PS Claim 1; Page 49-52; 106pp; French.
XX
CC This sequence represents clone cl.6A1 of the human endogenous retrovirus
CC (HERV) W genome. The nucleic acids, their fragments or peptides encoded
CC by them are markers of autoimmune disease (e.g. multiple sclerosis,
CC rheumatoid polyarthritis, disseminated lupus erythematosus, insulin-
CC dependent diabetes and related pathologies) and of abnormal or
CC unsuccessful pregnancy and can be used as chromosomal markers for
CC susceptibility to these conditions, or proximity markers of genes
CC associated with this susceptibility

XX
CC   The present sequence represents an endogenetic retroviral nucleic acid
CC   fragment, which is associated with an autoimmune disease, and is
CC   integrated into the human genome. The fragment is originally derived from
CC   a novel retrovirus, human endogenous retrovirus W (HERV-W). The HERV-W
CC   retrovirus is associated with autoimmune disease, failure of pregnancy or
CC   disorders of pregnancy. The nucleic acid fragment, or proteins derived
CC   from it, are useful for diagnosis of autoimmune disease (specifically
CC   multiple sclerosis) and for monitoring pregnancy. The nucleic acid
CC   fragments may also be used for in situ labelling of isolated chromosomes,
CC   while the transcription product can be used to study or monitor T cell
CC   proliferation in vitro

PT   New nucleic acid sequences from human endogenous retrovirus-W - expressed
PT   exclusively in placenta and useful in diagnosis and therapy of autoimmune
PT   disease, and abnormal or failed pregnancy.
XX
PS   Claim 1; Page 64-67; 106pp; French.
XX
CC   This sequence represents clone cl.Pi5T of the human endogenous retrovirus
CC   (HERV) W genome. The nucleic acids, their fragments or peptides encoded
CC   by them are markers of autoimmune disease (e.g. multiple sclerosis,
CC   rheumatoid polyarthritis, disseminated lupus erythematosus, insulin-
CC   dependent diabetes and related pathologies) and of abnormal or
CC   unsuccessful pregnancy and can be used as chromosomal markers for
CC   susceptibility to these conditions, or proximity markers of genes
CC   associated with this susceptibility

PS   Disclosure; Page 47-48; 53pp; French.
XX
CC   The present sequence represents an endogenetic retroviral nucleic acid
CC   fragment, which is associated with an autoimmune disease, and is
CC   integrated into the human genome. The fragment is originally derived from
CC   a novel retrovirus, human endogenous retrovirus W (HERV-W). The HERV-W
CC   retrovirus is associated with autoimmune disease, failure of pregnancy or
CC   disorders of pregnancy. The nucleic acid fragment, or proteins derived
CC   from it, are useful for diagnosis of autoimmune disease (specifically
CC   multiple sclerosis) and for monitoring pregnancy. The nucleic acid
CC   fragments may also be used for in situ labelling of isolated chromosomes,
CC   while the transcription product can be used to study or monitor T cell
CC   proliferation in vitro

PT New nucleic acid sequences of human endogenous retrovirus, HERV-7q, used
PT for diagnosis, treatment and prevention of autoimmune and neurological
PT diseases.
XX
PS Claim 1; Page 128-129; 225pp; French.
XX
CC The present invention relates to new nucleic acid sequences of human
CC endogenouse retrovirus, HERV-7q, which is located on chromosome 7q.
CC Regulatory elements associated with HERV-7q may alter expression of other
CC genes (even remote genes) on the same chromosome, inducing immunological
CC and/or neurological changes (which may be pathological or protective/
CC curative). HERV-7q peptides can be used to improve efficiency of the
CC immune response, e.g. in immunotherapy. HERV-7q peptides and their coding
CC sequences can be used in immunogenic or vaccinating compositions, for
CC protection against autoimmune diseases, particularly multiple sclerosis.
CC The peptides may also be used (by sequence comparison) to detect/identify
CC endogenous retroviruses that are abnormally expressed in cancer,
CC neuropathologies or other autoimmune diseases. The present sequence was
CC used to illustrate the invention

PT New nucleic acid sequences of human endogenous retrovirus, HERV-7q, used
PT for diagnosis, treatment and prevention of autoimmune and neurological
PT diseases.
XX
PS Claim 3; Page 133; 225pp; French.
XX
CC The present invention relates to new nucleic acid sequences of human
CC endogenouse retrovirus, HERV-7q, which is located on chromosome 7q.
CC Regulatory elements associated with HERV-7q may alter expression of other
CC genes (even remote genes) on the same chromosome, inducing immunological
CC and/or neurological changes (which may be pathological or protective/
CC curative). HERV-7q peptides can be used to improve efficiency of the
CC immune response, e.g. in immunotherapy. HERV-7q peptides and their coding
CC sequences can be used in immunogenic or vaccinating compositions, for
CC protection against autoimmune diseases, particularly multiple sclerosis.
CC The peptides may also be used (by sequence comparison) to detect/identify
CC endogenous retroviruses that are abnormally expressed in cancer,
CC neuropathologies or other autoimmune diseases. The present sequence was
CC used to illustrate the invention

PS   Claim 1; Page 68-70; 106pp; French.
XX
CC   This sequence represents clone cl.44.4 of the human endogenous retrovirus
CC   (HERV) W genome. The nucleic acids, their fragments or peptides encoded
CC   by them are markers of autoimmune disease (e.g. multiple sclerosis,
CC   rheumatoid polyarthritis, disseminated lupus erythematosus, insulin-
CC   dependent diabetes and related pathologies) and of abnormal or
CC   unsuccessful pregnancy and can be used as chromosomal markers for
CC   susceptibility to these conditions, or proximity markers of genes
CC   associated with this susceptibility

XX
PT New nucleic acid from human endogenous retrovirus, useful e.g. for
PT diagnosis of autoimmune disease and complications of pregnancy, contains
PT at least part of the gag gene.
XX
PS Disclosure; Page 49; 53pp; French.
XX
CC The present sequence represents an endogenetic retroviral nucleic acid
CC fragment, which is associated with an autoimmune disease, and is
CC integrated into the human genome. The fragment is originally derived from
CC a novel retrovirus, human endogenous retrovirus W (HERV-W). The HERV-W
CC retrovirus is associated with autoimmune disease, failure of pregnancy or
CC disorders of pregnancy. The nucleic acid fragment, or proteins derived
CC from it, are useful for diagnosis of autoimmune disease (specifically
CC multiple sclerosis) and for monitoring pregnancy. The nucleic acid
CC fragments may also be used for in situ labelling of isolated chromosomes,
CC while the transcription product can be used to study or monitor T cell
CC proliferation in vitro

XX
CC   This sequence represents clone cl.PH74 of the human endogenous retrovirus
CC   (HERV) W genome. The nucleic acids, their fragments or peptides encoded
CC   by them are markers of autoimmune disease (e.g. multiple sclerosis,
CC   rheumatoid polyarthritis, disseminated lupus erythematosus, insulin-
CC   dependent diabetes and related pathologies) and of abnormal or
CC   unsuccessful pregnancy and can be used as chromosomal markers for
CC   susceptibility to these conditions, or proximity markers of genes
CC   associated with this susceptibility

PT   New nucleic acid from human endogenous retrovirus, useful e.g. for
PT   diagnosis of autoimmune disease and complications of pregnancy, contains
PT   at least part of the gag gene.
XX
PS   Disclosure; Page 46-47; 53pp; French.
XX
CC   The present sequence represents an endogenetic retroviral nucleic acid
CC   fragment, which is associated with an autoimmune disease, and is
CC   integrated into the human genome. The fragment is originally derived from
CC   a novel retrovirus, human endogenous retrovirus W (HERV-W). The HERV-W
CC   retrovirus is associated with autoimmune disease, failure of pregnancy or
CC   disorders of pregnancy. The nucleic acid fragment, or proteins derived
CC   from it, are useful for diagnosis of autoimmune disease (specifically
CC   multiple sclerosis) and for monitoring pregnancy. The nucleic acid
CC   fragments may also be used for in situ labelling of isolated chromosomes,
CC   while the transcription product can be used to study or monitor T cell
CC   proliferation in vitro

XX
CC On the basis of the PBS t-RNA motif used for the classification of human
CC endogenous retrovirus (HERVs) the full length endogenous provirus which
CC was been located on the long arm of human chromosome 7 (7q21-22) has been
CC designated HERV-W. The present invention describes proteins or peptides
CC (I) having superantigen (SAg) activity comprising the ENV protein (ENV)
CC of HERV-W, the surface protein (SU) and transmembrane (TM) sub-units. (I)
CC have neuroprotective activity, and can be used in: vaccines; antisense-
CC therapy; and HERV-W SAg activity-inhibitors. (I) and encoding DNA/RNA are
CC useful for diagnosing multiple sclerosis (MS) or HERV-W-associated
CC disorders. (I) are also useful for identifying substances (and optionally
CC recovering) capable of binding to a retroviral superantigen associated
CC with MS, substances capable of blocking SAg activity and substances
CC capable of blocking transcription or translation of HERV-W retroviral
CC superantigen. A protein or peptide derived from (I), modified to be
CC devoid of SAg activity and being capable of generating an immune response
CC against HERV-W retroviral SAg is useful in therapy. Nucleic acid
CC molecules encoding (I) are useful as vaccines against MS. Substances
CC capable of blocking SAg activity, capable of binding to a retroviral
CC superantigen associated with MS, or capable of blocking transcription or
CC translation of HERV-W retroviral superantigen for use in treating or
CC preventing MS, obtained using (I) are useful for the treatment and
CC prevention of MS. (I) and nucleic acids encoding them are useful for
CC diagnosing autoimmune disease. The present sequence encodes the
CC specifically claimed envelope protein of HERV-W designated G

XX
CC   The present sequence encodes a human endogenous retrovirus envelope
CC   protein. The specification describes a method for detecting expression of
CC   an envelope protein from a human endogenous retrovirus (HERV), in cells,
CC   of a tissue or culture. The method comprises detecting syncytia formation
CC   due to the fusogenic properties of the envelope protein. Envelope
CC   polypeptides and polynucleotides are used to produce therapeutic or
CC   prophylactic compositions, particularly for treatment of cancer, to
CC   correct defects in placental development (or other natural formation of
CC   other types of syncytia), and to promote adhesion of cells in grafts or
CC   cellular repair processes. Expression of sequences antisense to the
CC   polynucleotide are used to prevent formation of syncytia

PT New nucleic acid sequences of human endogenous retrovirus, HERV-7q, used
PT for diagnosis, treatment and prevention of autoimmune and neurological
PT diseases.
XX
PS Claim 3; Page 142-145; 225pp; French.
XX
CC The present invention relates to new nucleic acid sequences of human
CC endogenouse retrovirus, HERV-7q, which is located on chromosome 7q.
CC Regulatory elements associated with HERV-7q may alter expression of other
CC genes (even remote genes) on the same chromosome, inducing immunological
CC and/or neurological changes (which may be pathological or protective/
CC curative). HERV-7q peptides can be used to improve efficiency of the
CC immune response, e.g. in immunotherapy. HERV-7q peptides and their coding
CC sequences can be used in immunogenic or vaccinating compositions, for
CC protection against autoimmune diseases, particularly multiple sclerosis.
CC The peptides may also be used (by sequence comparison) to detect/identify
CC endogenous retroviruses that are abnormally expressed in cancer,
CC neuropathologies or other autoimmune diseases. The present sequence was
CC used to illustrate the invention

PT New nucleic acid from retroviruses - useful for diagnosis, prevention and
PT treatment of, e.g. multiple sclerosis.
XX
PS Claim 1; Page 174-175; 286pp; English.
XX
CC The present sequence represents the multiple sclerosis (MS) associated
CC retrovirus-1 (MSRV-1) pol gene fragment. The invention provides complete
CC or partial genomic sequences of the MSRV-1 pol gene, gag gene and env
CC gene, and polypeptides encoded by these genes. The invention also
CC provides antibodies raised against the polypeptides. The genomic
CC sequences, polypeptides and antibodies are also claimed useful for
CC diagnosing infection by MS and rheumatoid arthritis-associated viruses,
CC and also for prevention and treatment of infection with these viruses

PT  New isolated nucleic acid and their fragments having the pol gene of a
PT  retrovirus, useful for diagnosing, preventing and/or treating multiple
PT  sclerosis and/or rheumatoid arthritis.
XX
PS  Claim 3; SEQ ID NO 87; 193pp; English.
XX
CC  The invention relates to an isolated nucleic acid which comprises the pol
CC  gene of a retrovirus associated with multiple sclerosis or rheumatoid
CC  arthritis. The methods and compositions of the present invention are
CC  useful for diagnosing, preventing and/or treating multiple sclerosis
CC  and/or rheumatoid arthritis. The present sequence is used in the
CC  exemplification of the invention.

XX
PT   New nucleic acid sequences from human endogenous retrovirus-W - expressed
PT   exclusively in placenta and useful in diagnosis and therapy of autoimmune
PT   disease, and abnormal or failed pregnancy.
XX
PS   Claim 1; Page 54-56; 106pp; French.
XX
CC   This sequence represents clone cl.Pi22 of the human endogenous retrovirus
CC   (HERV) W genome. The nucleic acids, their fragments or peptides encoded
CC   by them are markers of autoimmune disease (e.g. multiple sclerosis,
CC   rheumatoid polyarthritis, disseminated lupus erythematosus, insulin-
CC   dependent diabetes and related pathologies) and of abnormal or
CC   unsuccessful pregnancy and can be used as chromosomal markers for
CC   susceptibility to these conditions, or proximity markers of genes
CC   associated with this susceptibility
XX

PT   New isolated or purified nucleic acid associated with multiple sclerosis
PT   and/or rheumatoid arthritis, useful for detecting a virus associated with
PT   multiple sclerosis or rheumatoid arthritis in a biological sample.
XX
PS   Example 18; Fig 46; 193pp; English.
XX
CC   The invention relates to an isolated or purified nucleic acid from a
CC   virus associated with multiple sclerosis and/or rheumatoid arthritis,
CC   multiple sclerosis-associated virus (MSRV)-1. The nucleic acids comprise
CC   pol, gag or reverse transcriptase genes (or their fragments) encoding the
CC   proteins or defined peptides (including immunodominant peptides,
CC   antigenic peptides or conserved motifs).Also included are a process for
CC   detecting a virus associated with multiple sclerosis or rheumatoid
CC   arthritis in a biological sample, a nucleic acid probe for the detection
CC   of a virus associated with multiple sclerosis or rheumatoid arthritis, a
CC   primer for the amplification by polymerisation of a nucleic acid of a
CC   viral material associated with multiple sclerosis or rheumatoid
CC   arthritis, a polypeptide exhibiting an inhibitory activity on the
CC   proteolytic, reverse transcriptase or ribonuclease H activity from MSRV,
CC   and an antibody directed against the MSRV-1 virus obtained by
CC   immunologically reacting a human or animal body or cells with an
CC   immunogenic agent consisting of the antigenic polypeptide defined above.
CC   The nucleic acids are useful for detecting a biological sample a virus
CC   associated with multiple sclerosis or rheumatoid arthritis, or for
CC   detecting in a biological sample, the presence of or exposure to a virus
CC   associated with multiple sclerosis or rheumatoid arthritis. The present
CC   sequence is an MSRV gene, gene fragment or gene consensus sequence. Note:
CC   The SEQ ID numbers for the sequences as displayed in the main body of the
CC   patent do not match the SEQ ID numbers in the sequence listing.
CC   Consequently those sequences mentioned in the claims may not be the
CC   sequences the authors intended to claim.

XX
CC   The invention relates to human embryogenesis associated proteins (EMBRY)
CC   and nucleic acid molecules encoding such proteins. EMBRY sequences are
CC   useful for screening modulators useful for treating or preventing
CC   disorders associated with abnormal expression of EMBRY. The disorders
CC   treated include reproductive disorders such as infertility,
CC   endometriosis, endometrial or ovarian tumour; autoimmune/inflammatory
CC   disorder such as acquired immune deficiency syndrome (AIDS), allergies,
CC   contact dermatitis; disorders of the placenta such as preeclampsia,
CC   abruptio placentae etc. Sequences of the invention are also useful for
CC   analysing a proteome of a tissue or a cell type. EMBRY proteins are
CC   useful as immunogens for preparing antibodies. Polynucleotides of the
CC   invention are useful for creating knockin humanised animals or transgenic
CC   animals to model human diseases. They are also used in gene therapy. The
CC   present sequence is human EMBRY-2 cDNA

PT   (MSRV) used to detect the presence of MSRV-1 retrovirus in a biological
PT   sample.
XX
PS   Disclosure; Fig 2; 23pp; English.
XX
CC   The present sequence represents the nucleotide sequence corresponding to
CC   the 3' env region and long terminal repeat sequences from clone CL6 of
CC   Multiple Sclerosis retrovirus (MSRV-1). The specification describes a
CC   long terminal repeat (LTR)-RU5 region which encodes the expression of a
CC   MSRV-1 protein. This is unusual for LTRs, in particular in the RU5
CC   region. The sequence includes CAAT and TATA signals which are present in
CC   the U3 and R regions and are not directed towards the CDS indicated in
CC   the features table. Probes and antibodies to the MSRV-1 retrovirus
CC   protein and encoding polynucleotide sequences are used to detect the
CC   presence of MSRV-1 retrovirus in a biological sample. (Updated on 06-AUG-
CC   2003 to correct OS field.)

PT   New human retrovirus HERV-W ENV proteins/peptides having superantigen
PT   activity useful for diagnosing and treating multiple sclerosis.
XX
PS   Claim 13; Fig 10; 94pp; English.
XX
CC   On the basis of the PBS t-RNA motif used for the classification of human
CC   endogenous retrovirus (HERVs) the full length endogenous provirus which
CC   was been located on the long arm of human chromosome 7 (7q21-22) has been
CC   designated HERV-W. The present invention describes proteins or peptides
CC   (I) having superantigen (SAg) activity comprising the ENV protein (ENV)
CC   of HERV-W, the surface protein (SU) and transmembrane (TM) sub-units. (I)
CC   have neuroprotective activity, and can be used in: vaccines; antisense-
CC   therapy; and HERV-W SAg activity-inhibitors. (I) and encoding DNA/RNA are
CC   useful for diagnosing multiple sclerosis (MS) or HERV-W-associated
CC   disorders. (I) are also useful for identifying substances (and optionally
CC   recovering) capable of binding to a retroviral superantigen associated
CC   with MS, substances capable of blocking SAg activity and substances
CC   capable of blocking transcription or translation of HERV-W retroviral
CC   superantigen. A protein or peptide derived from (I), modified to be
CC   devoid of SAg activity and being capable of generating an immune response
CC   against HERV-W retroviral SAg is useful in therapy. Nucleic acid
CC   molecules encoding (I) are useful as vaccines against MS. Substances
CC   capable of blocking SAg activity, capable of binding to a retroviral
CC   superantigen associated with MS, or capable of blocking transcription or
CC   translation of HERV-W retroviral superantigen for use in treating or
CC   preventing MS, obtained using (I) are useful for the treatment and
CC   prevention of MS. (I) and nucleic acids encoding them are useful for
CC   diagnosing autoimmune disease. The present sequence encodes the
CC   specifically claimed envelope protein of HERV-W designated G

PS Disclosure; SEQ ID NO 73; 262pp; English.
XX
CC The invention describes a polypeptide of 7-20 amino acid residues, which
CC is capable of modulating the immunosuppressive properties of a viral
CC protein or its fragment, against the host in which it is expressed
CC (immunosuppression-modulatory sequence) when it substitutes the
CC homologous sequence of the viral protein or its fragment, the polypeptide
CC comprising the minimum following consensus amino acid sequence of (I).
CC Also described are: a mutated ENV protein resulting from the mutation of
CC a wild type ENV protein essentially carrying the following sequence: NY 1
CC Y 2 Y 3 LY 4 Y 5 LY 6 Y 7 Y 8 X 1 Y 9 Y 10 Y 11 CY 12 X 2 (II); a nucleic
CC acid coding for the polypeptide or the mutated ENV protein; an eukaryotic
CC or prokaryotic expression vector comprising the nucleic acid as well as
CC the elements necessary for the expression of the nucleic acid; a
CC recombinant cell comprising the nucleic acid or the eukaryotic or
CC prokaryotic expression vector; a pharmaceutical or a vaccine composition
CC comprising as active substance: at least one polypeptide, mutated ENV
CC protein or its fragments, nucleic acid, prokaryotic or eukaryotic
CC expression vector, or recombinant cell; in association with a
CC pharmaceutically acceptable carrier; and antibodies or their fragments,
CC scFv polypeptides, aptamers, or binding peptides, directed against
CC mutated ENV proteins, provided that the antibodies or their fragments,
CC scFv polypeptides, aptamers, or binding peptides do not bind to the
CC corresponding wild type ENV proteins. The first mutation of a first amino
CC acid and optionally of a second mutation of a second amino acid in a wild
CC type viral envelope (ENV) protein is useful for manufacturing a mutated
CC ENV protein having a modified immunosuppressive activity with respect to
CC the wild type ENV protein. The protein is useful for the manufacture of a
CC medicament or a vaccine intended for the prevention and/or the treatment
CC of viral diseases, such as HTLV or FeLV infections; cancer; pathologies
CC requiring an inhibition of the immune system, such as autoimmune

```
CC   diseases, allergies or graft rejections. The protein is also useful for
CC   screening compounds liable to modulate the immunosuppressive activity of
CC   viruses or tumor cells, where the compounds to screen are peptides, in
CC   particular peptides comprising from 5-30 amino acids, such as peptides
CC   originating from combinatorial peptide libraries. This sequence encodes
CC   HERV envelope protein.

XX
PS Claim 41; SEQ ID NO 115; 262pp; English.
XX
CC The invention describes a polypeptide of 7-20 amino acid residues, which
CC is capable of modulating the immunosuppressive properties of a viral
CC protein or its fragment, against the host in which it is expressed
CC (immunosuppression-modulatory sequence) when it substitutes the
CC homologous sequence of the viral protein or its fragment, the polypeptide
CC comprising the minimum following consensus amino acid sequence of (I).
CC Also described are: a mutated ENV protein resulting from the mutation of
CC a wild type ENV protein essentially carrying the following sequence: NY 1
CC Y 2 Y 3 LY 4 Y 5 LY 6 Y 7 Y 8 X 1 Y 9 Y 10 Y 11 CY 12 X 2 (II); a nucleic
CC acid coding for the polypeptide or the mutated ENV protein; an eukaryotic
CC or prokaryotic expression vector comprising the nucleic acid as well as
CC the elements necessary for the expression of the nucleic acid; a
CC recombinant cell comprising the nucleic acid or the eukaryotic or
CC prokaryotic expression vector; a pharmaceutical or a vaccine composition
CC comprising as active substance: at least one polypeptide, mutated ENV
CC protein or its fragments, nucleic acid, prokaryotic or eukaryotic
CC expression vector, or recombinant cell; in association with a
CC pharmaceutically acceptable carrier; and antibodies or their fragments,
CC scFv polypeptides, aptamers, or binding peptides, directed against
CC mutated ENV proteins, provided that the antibodies or their fragments,
CC scFv polypeptides, aptamers, or binding peptides do not bind to the
CC corresponding wild type ENV proteins. The first mutation of a first amino
CC acid and optionally of a second mutation of a second amino acid in a wild
CC type viral envelope (ENV) protein is useful for manufacturing a mutated
CC ENV protein having a modified immunosuppressive activity with respect to
CC the wild type ENV protein. The protein is useful for the manufacture of a
CC medicament or a vaccine intended for the prevention and/or the treatment
CC of viral diseases, such as HTLV or FeLV infections; cancer; pathologies
CC requiring an inhibition of the immune system, such as autoimmune
CC diseases, allergies or graft rejections. The protein is also useful for
CC screening compounds liable to modulate the immunosuppressive activity of
CC viruses or tumor cells, where the compounds to screen are peptides, in
CC particular peptides comprising from 5-30 amino acids, such as peptides
CC originating from combinatorial peptide libraries. This sequence encodes
CC HERV envelope protein.

PT   New polypeptide capable of modulating the immunosuppressive properties of
PT   a viral protein or its fragment, useful for the manufacture of a vaccine
PT   for treating or preventing viral infections or cancer.
XX
PS   Claim 41; SEQ ID NO 117; 262pp; English.
XX
CC   The invention describes a polypeptide of 7-20 amino acid residues, which
CC   is capable of modulating the immunosuppressive properties of a viral
CC   protein or its fragment, against the host in which it is expressed
CC   (immunosuppression-modulatory sequence) when it substitutes the
CC   homologous sequence of the viral protein or its fragment, the polypeptide
CC   comprising the minimum following consensus amino acid sequence of (I).
CC   Also described are: a mutated ENV protein resulting from the mutation of
CC   a wild type ENV protein essentially carrying the following sequence: NY 1
CC   Y 2 Y 3 LY 4 Y 5 LY 6 Y 7 Y 8 X 1 Y 9 Y 10 Y 11 CY 12 X 2 (II); a nucleic
CC   acid coding for the polypeptide or the mutated ENV protein; an eukaryotic
CC   or prokaryotic expression vector comprising the nucleic acid as well as
CC   the elements necessary for the expression of the nucleic acid; a
CC   recombinant cell comprising the nucleic acid or the eukaryotic or
CC   prokaryotic expression vector; a pharmaceutical or a vaccine composition
CC   comprising as active substance: at least one polypeptide, mutated ENV
CC   protein or its fragments, nucleic acid, prokaryotic or eukaryotic
CC   expression vector, or recombinant cell; in association with a
CC   pharmaceutically acceptable carrier; and antibodies or their fragments,
CC   scFv polypeptides, aptamers, or binding peptides, directed against
CC   mutated ENV proteins, provided that the antibodies or their fragments,
CC   scFv polypeptides, aptamers, or binding peptides do not bind to the
CC   corresponding wild type ENV proteins. The first mutation of a first amino
CC   acid and optionally of a second mutation of a second amino acid in a wild
CC   type viral envelope (ENV) protein is useful for manufacturing a mutated
CC   ENV protein having a modified immunosuppressive activity with respect to
CC   the wild type ENV protein. The protein is useful for the manufacture of a
CC   medicament or a vaccine intended for the prevention and/or the treatment
CC   of viral diseases, such as HTLV or FeLV infections; cancer; pathologies
CC   requiring an inhibition of the immune system, such as autoimmune
CC   diseases, allergies or graft rejections. The protein is also useful for
CC   screening compounds liable to modulate the immunosuppressive activity of
CC   viruses or tumor cells, where the compounds to screen are peptides, in
CC   particular peptides comprising from 5-30 amino acids, such as peptides
CC   originating from combinatorial peptide libraries. This sequence encodes
CC   HERV envelope protein.

PT   Human genome-derived single exon nucleic acid probes useful for analyzing
PT   gene expression in human cervical epithelial cells.
XX
PS   Claim 25; SEQ ID NO 4541; 487pp; English.
XX
CC   The present invention relates to human single exon nucleic acid probes
CC   (SENP). The present sequence is one such probe. The SENPs are derived
CC   from human HeLa cells. The SENPs can be used to produce a single exon
CC   microarray, which can be used for measuring human gene expression in a
CC   sample derived from human cervical epithelial cells. By measuring gene
CC   expression, the probes are therefore useful in grading and/or staging of
CC   diseases of the cervix, notably cervical cancer. Note: The sequence data
CC   for this patent did not form part of the printed specification, but was
CC   obtained in electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PT  Human genome-derived single exon nucleic acid probes useful for analyzing
PT  gene expression in human fetal liver.
XX
PS  Claim 1; SEQ ID NO 4642; 639pp + Sequence Listing; English.
XX
CC  The invention relates to a single exon nucleic acid probe for measuring
CC  human gene expression in a sample derived from human foetal liver. The
CC  single exon nucleic acid probes may be used for predicting, measuring and
CC  displaying gene expression in samples derived from human fetal liver. The
CC  present sequence is a single exon nucleic acid probe of the invention.

```
CC   Note: The sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO

XX
CC   The present invention relates to single exon nucleic acid probes (SENP).
CC   The present sequence is one such probe. The probes are useful for
CC   producing a microarray for predicting, measuring and displaying gene
CC   expression in samples derived from human placenta. The probes are useful
CC   for antenatal diagnosis of human genetic disorders

PT   New spatially-addressable set of single exon nucleic acid probes, useful
PT   for measuring gene expression in sample derived from human breast,
PT   comprises number of single exon nucleic acid probes.
XX
PS   Claim 1; SEQ ID NO 4517; 327pp + Sequence Listing; English.
XX
CC   The invention relates to a spatially-addressable set of single exon
CC   nucleic acid probes for measuring gene expression in a sample derived
CC   from human breast and BT 474 cells. The method involves contacting the
CC   probes with a collection of detectably labelled nucleic acids derived
CC   from mRNA of human breast, and then measuring the label bound to each
CC   probe of the microarray. The probes are useful for verifying the
CC   expression of regions of genomic DNA predicted to encode proteins. They
CC   are useful for gene discovery, and for determining predisposition and/or
CC   prognosing breast disease. Gene expression analysis is useful for
CC   assessing the toxicity of chemical agents on cells. The microarray of
CC   this invention presents a far greater diversity of probes for measuring
CC   gene expression, with far less bias than expressed sequence tag
CC   microarrays. The method is suitable for rapid production of functional
CC   information from genomic sequence. The present sequence is a single exon
CC   nucleic acid probe of the invention. Note: The sequence data for this
CC   patent did not form part of the printed specification, but was obtained
CC   in electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PT Single exon nucleic acid probes for analyzing gene expression in human
PT hearts.
XX
PS Claim 1; SEQ ID NO 4444; 530pp; English.
XX
CC The present invention relates to single exon nucleic acid probes for
CC measuring human gene expression in a sample derived from human heart. The
CC present sequence is one such probe. The probes may be used for
CC predicting, measuring and displaying gene expression in samples derived
CC from the human heart via microarrays. By measuring gene expression, the
CC probes are useful for predicting, diagnosing, grading, staging,
CC monitoring and prognosing diseases of the human heart and vascular system
CC e.g. cardiovascular disease, hypertension, cardiac arrhythmias and
CC congenital heart disease. Note: The sequence data for this patent did not
CC form part of the printed specification, but was obtained in electronic
CC format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

PT   Single exon nucleic acid probes for analyzing gene expression in human
PT   brains.
XX
PS   Example 4; SEQ ID NO 4507; 650pp + Sequence Listing; English.
XX
CC   The present invention provides a number of single exon nucleic acid
CC   probes which are derived from genomic sequences expressed in the human
CC   brain. They can be used to measure gene expression in brain cell samples,
CC   which may enable the diagnosis and improved treatment of nervous system
CC   diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia,
CC   epilepsy and cancers. The present sequence is one of the probes of the
CC   invention

PT   Human genome-derived single exon nucleic acid probes useful for analyzing
PT   gene expression in human adult liver.
XX
PS   Claim 1; SEQ ID NO 4660; 658pp; English.
XX
CC   The invention relates to a single exon nucleic acid probe (SENP) (I) for
CC   measuring human gene expression in a sample derived from human adult
CC   liver, comprising one of 13109 defined nucleotide sequences given in the
CC   specification (or complements/ fragments). The probe hybridises at high
CC   stringency to a nucleic acid molecule expressed in the human adult liver.
CC   (I) may be used for predicting, measuring and displaying gene expression
CC   in samples derived from human adult liver. The genes identified may be
CC   involved in genetic liver diseases such as cirrhosis,
CC   hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is
CC   associated with coronary heart disease. ABS25011-ABS51005 represent human
CC   liver single exon nucleic acid probes of the invention. Note: The
CC   sequence information for this patent does not appear in the printed
CC   specification but was obtained in electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PT   Novel single exon nucleic acid probe used to measuring gene expression in
PT   a human breast.
XX
PS   Claim 25; SEQ ID NO 4413; 322pp; English.
XX
CC   The present invention relates to novel single exon nucleic acid probes.
CC   The present sequence is one such probe. The probes are useful for
CC   measuring human gene expression in a human breast sample, where the probe
CC   hybridises at high stringency to a nucleic acid expressed in the human
CC   breast. The probes are useful for predicting, diagnosing, grading,
CC   staging, monitoring and prognosing diseases of the human breast,
CC   particularly those diseases with polygenic aetiology. The diseases
CC   include: breast cancer, disorders of development, inflammatory diseases
CC   of the breast, fibrocystic changes, proliferative breast disease and non-
CC   carcinoma tumours. Note: The sequence data for this patent did not form
CC   part of the printed specification, but was obtained in electronic format
CC   directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

```
XX
PS   Claim 1; SEQ ID NO 4580; 634pp; English.
XX
CC   The invention relates to a spatially-addressable set of single exon
CC   nucleic acid probes for measuring gene expression in a sample derived
CC   from human lung comprising single exon nucleic acid probes having one of
CC   12614 nucleic acid sequences mentioned in the specification, or their
CC   complements or the 12387 open reading frames derived from the 12614
CC   probes. Also included are a microarray comprising the novel set of probes
CC   ; the novel set of probes which hybridise at high stringency to a nucleic
CC   acid expressed in the human lung; measuring gene expression in a sample
CC   derived from human lung, comprising (a) contacting the array with a
CC   collection of detectably labeled nucleic acids derived from human lung
CC   mRNA, and (b) measuring the label detectably bound to each probe of the
CC   array; identifying exons in a eukaryotic genome, comprising (a)
CC   algorithmically predicting at least one exon from genomic sequences of
CC   the eukaryote; and (b) detecting specific hybridisation of detectably
CC   labeled nucleic acids from eukaryote lung mRNA, to a single exon probe,
CC   having a fragment identical to the predicted exon, the probe is included
CC   in the above mentioned microarray; assigning exons to a single gene,
CC   comprising (a) identifying exons from genomic sequence by the method
CC   above and (b) measuring the expression of each of the exons in several
CC   tissues and/or cell types using hybridisation to a single exon
CC   microarrays having a probe with the exon, where a common pattern of
CC   expression of the exons in the tissues and/or cell types indicates that
CC   the exons should be assigned to a single gene; a peptide comprising one
CC   of 12011 sequences, mentioned in the specification, or encoded by the
CC   probes/open reading frames (ORF). The probes are used for gene expression
CC   analysis, and for identifying exons in a gene, particularly using human
CC   lung derived mRNA and for the study of lung diseases such as asthma, lung
CC   cancer, chronic obstructive pulmonary disease (COPD), interstitial lung
CC   disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis,
CC   tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-
CC   Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary
CC   histiocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis,
CC   Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary
CC   dyskinesis, pulmonary hypertension and hyaline membrane disease. The
CC   present sequence is a single exon probe of the invention. Note: The
CC   sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/published_pct_sequences

PT   New nucleic acid sequences of human endogenous retrovirus, HERV-7q, used
PT   for diagnosis, treatment and prevention of autoimmune and neurological
PT   diseases.
XX
PS   Claim 3; Page 134; 225pp; French.
XX
CC   The present invention relates to new nucleic acid sequences of human
CC   endogenouse retrovirus, HERV-7q, which is located on chromosome 7q.
CC   Regulatory elements associated with HERV-7q may alter expression of other
CC   genes (even remote genes) on the same chromosome, inducing immunological
CC   and/or neurological changes (which may be pathological or protective/
CC   curative). HERV-7q peptides can be used to improve efficiency of the
CC   immune response, e.g. in immunotherapy. HERV-7q peptides and their coding
CC   sequences can be used in immunogenic or vaccinating compositions, for
CC   protection against autoimmune diseases, particularly multiple sclerosis.
CC   The peptides may also be used (by sequence comparison) to detect/identify
CC   endogenous retroviruses that are abnormally expressed in cancer,
CC   neuropathologies or other autoimmune diseases. The present sequence was
CC   used to illustrate the invention

XX
CC   This sequence represents clone cl.24.4 of the human endogenous retrovirus
CC   (HERV) W genome. The nucleic acids, their fragments or peptides encoded
CC   by them are markers of autoimmune disease (e.g. multiple sclerosis,
CC   rheumatoid polyarthritis, disseminated lupus erythematosus, insulin-
CC   dependent diabetes and related pathologies) and of abnormal or
CC   unsuccessful pregnancy and can be used as chromosomal markers for
CC   susceptibility to these conditions, or proximity markers of genes
CC   associated with this susceptibility

XX
CC   The present sequence represents an endogenetic retroviral nucleic acid
CC   fragment, which is associated with an autoimmune disease, and is
CC   integrated into the human genome. The fragment is originally derived from
CC   a novel retrovirus, human endogenous retrovirus W (HERV-W). The HERV-W
CC   retrovirus is associated with autoimmune disease, failure of pregnancy or
CC   disorders of pregnancy. The nucleic acid fragment, or proteins derived
CC   from it, are useful for diagnosis of autoimmune disease (specifically
CC   multiple sclerosis) and for monitoring pregnancy. The nucleic acid
CC   fragments may also be used for in situ labelling of isolated chromosomes,
CC   while the transcription product can be used to study or monitor T cell
CC   proliferation in vitro

PT   Detecting superantigen activity, useful for identifying agents for
PT   treatment or prevention of autoimmune disease, from expansion or loss of
PT   particular lymphocyte Vbeta determinants.
XX
PS   Claim 25; Page 123-124; 134pp; French.
XX
CC   The present sequence encodes an envelope protein of MSRV-1. The envelope
CC   protein expressed by the endogenous human retrovirus MRSV-1 has
CC   superantigen activity associated with autoimmune disease. The protien can
CC   be detected using the method of the invention. The specification
CC   describes a process for detecting activity of a superantigen in a
CC   biological sample. The process comprises identifying large scale
CC   expansion or loss of lymphocytes that carry at least one of the Vbeta16
CC   and/or Vbeta17 determinants. The method is used to screen for agents that
CC   inhibit the superantigen, especially those associated with MRSV-1 which
CC   is implicated in autoimmune disease, particularly multiple sclerosis.
CC   These agents are potentially useful for treatment or prevention (e.g. as
CC   vaccines) of autoimmune diseases

PT  New isolated polynucleotide and encoded polypeptides, useful in
PT  diagnostics, forensics, gene mapping, identification of mutations
PT  responsible for genetic disorders or other traits and to assess
PT  biodiversity.
XX
PS  Claim 1; SEQ ID NO 9505; 103pp; English.
XX
CC  The invention relates to isolated polynucleotide (I) and polypeptide (II)
CC  sequences. (I) is useful as hybridisation probes, polymerase chain
CC  reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
CC  and in recombinant production of (II). The polynucleotides are also used
CC  in diagnostics as expressed sequence tags for identifying expressed

```
CC   genes. (I) is useful in gene therapy techniques to restore normal
CC   activity of (II) or to treat disease states involving (II). (II) is
CC   useful for generating antibodies against it, detecting or quantitating a
CC   polypeptide in tissue, as molecular weight markers and as a food
CC   supplement. (II) and its binding partners are useful in medical imaging
CC   of sites expressing (II). (I) and (II) are useful for treating disorders
CC   involving aberrant protein expression or biological activity. The
CC   polypeptide and polynucleotide sequences have applications in
CC   diagnostics, forensics, gene mapping, identification of mutations
CC   responsible for genetic disorders or other traits to assess biodiversity
CC   and to produce other types of data and products dependent on DNA and
CC   amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
CC   coding sequences of the invention. Note: The sequence data for this
CC   patent did not appear in the printed specification, but was obtained in
CC   electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PS   Claim 1; Page 52-54; 106pp; French.
XX
CC   This sequence represents clone cl.7A16 of the human endogenous retrovirus
CC   (HERV) W genome. The nucleic acids, their fragments or peptides encoded
CC   by them are markers of autoimmune disease (e.g. multiple sclerosis,
CC   rheumatoid polyarthritis, disseminated lupus erythematosus, insulin-
CC   dependent diabetes and related pathologies) and of abnormal or
CC   unsuccessful pregnancy and can be used as chromosomal markers for
CC   susceptibility to these conditions, or proximity markers of genes
CC   associated with this susceptibility

XX
PS   Disclosure; Page 44; 53pp; French.
XX
CC   The present sequence represents an endogenetic retroviral nucleic acid
CC   fragment, which is associated with an autoimmune disease, and is
CC   integrated into the human genome. The fragment is originally derived from
CC   a novel retrovirus, human endogenous retrovirus W (HERV-W). The HERV-W
CC   retrovirus is associated with autoimmune disease, failure of pregnancy or
CC   disorders of pregnancy. The nucleic acid fragment, or proteins derived
CC   from it, are useful for diagnosis of autoimmune disease (specifically
CC   multiple sclerosis) and for monitoring pregnancy. The nucleic acid
CC   fragments may also be used for in situ labelling of isolated chromosomes,
CC   while the transcription product can be used to study or monitor T cell
CC   proliferation in vitro

PT   New nucleic acid from retroviruses - useful for diagnosis, prevention and
PT   treatment of, e.g. multiple sclerosis.
XX
PS   Disclosure; Page 184-185; 286pp; English.
XX
CC   The present sequence represents a multiple sclerosis (MS) associated
CC   retrovirus (MSRV) genomic fragment used in the method of the invention.
CC   The invention provides complete or partial genomic sequences of the MSRV-
CC   1 pol gene, gag gene and env gene, and polypeptides encoded by these
CC   genes. The invention also provides antibodies raised against the
CC   polypeptides. The genomic sequences, polypeptides and antibodies are also
CC   claimed useful for diagnosing infection by MS and rheumatoid arthritis-
CC   associated viruses, and also for prevention and treatment of infection
CC   with these viruses

PS   Claim 1; Page 37-38; 83pp; French.
XX
CC   This sequence represents clone C15 from a novel multiple sclerosis
CC   related virus type 1 (MSRV1). The sequence can be used in diagnostic,
CC   prophylactic or therapeutic compositions to inhibit expression of a
CC   multiple sclerosis related virus and/or virus associated with rheumatoid
CC   polyarthritis. (Updated on 27-AUG-2003 to correct OS field.) (Updated on
CC   17-OCT-2003 to standardise OS field)

PT New isolated nucleic acid and their fragments having the pol gene of a
PT retrovirus, useful for diagnosing, preventing and/or treating multiple
PT sclerosis and/or rheumatoid arthritis.
XX
PS Disclosure; SEQ ID NO 105; 193pp; English.
XX
CC The invention relates to an isolated nucleic acid which comprises the pol
CC gene of a retrovirus associated with multiple sclerosis or rheumatoid
CC arthritis. The methods and compositions of the present invention are
CC useful for diagnosing, preventing and/or treating multiple sclerosis
CC and/or rheumatoid arthritis. The present sequence is used in the
CC exemplification of the invention.

PT   New isolated or purified nucleic acid associated with multiple sclerosis
PT   and/or rheumatoid arthritis, useful for detecting a virus associated with
PT   multiple sclerosis or rheumatoid arthritis in a biological sample.
XX
PS   Example 19; Fig 52A; 193pp; English.
XX
CC   The invention relates to an isolated or purified nucleic acid from a
CC   virus associated with multiple sclerosis and/or rheumatoid arthritis,
CC   multiple sclerosis-associated virus (MSRV)-1. The nucleic acids comprise
CC   pol, gag or reverse transcriptase genes (or their fragments) encoding the
CC   proteins or defined peptides (including immunodominant peptides,
CC   antigenic peptides or conserved motifs).Also included are a process for
CC   detecting a virus associated with multiple sclerosis or rheumatoid
CC   arthritis in a biological sample, a nucleic acid probe for the detection
CC   of a virus associated with multiple sclerosis or rheumatoid arthritis, a
CC   primer for the amplification by polymerisation of a nucleic acid of a
CC   viral material associated with multiple sclerosis or rheumatoid
CC   arthritis, a polypeptide exhibiting an inhibitory activity on the
CC   proteolytic, reverse transcriptase or ribonuclease H activity from MSRV,
CC   and an antibody directed against the MSRV-1 virus obtained by
CC   immunologically reacting a human or animal body or cells with an
CC   immunogenic agent consisting of the antigenic polypeptide defined above.
CC   The nucleic acids are useful for detecting a biological sample a virus
CC   associated with multiple sclerosis or rheumatoid arthritis, or for
CC   detecting in a biological sample, the presence of or exposure to a virus
CC   associated with multiple sclerosis or rheumatoid arthritis. The present
CC   sequence is an MSRV gene, gene fragment or gene consensus sequence. Note:
CC   The SEQ ID numbers for the sequences as displayed in the main body of the
CC   patent do not match the SEQ ID numbers in the sequence listing.
CC   Consequently those sequences mentioned in the claims may not be the
CC   sequences the authors intended to claim.

PT   New isolated nucleic acid and their fragments having the pol gene of a
PT   retrovirus, useful for diagnosing, preventing and/or treating multiple
PT   sclerosis and/or rheumatoid arthritis.
XX
PS   Disclosure; SEQ ID NO 207; 193pp; English.
XX
CC   The invention relates to an isolated nucleic acid which comprises the pol
CC   gene of a retrovirus associated with multiple sclerosis or rheumatoid
CC   arthritis. The methods and compositions of the present invention are
CC   useful for diagnosing, preventing and/or treating multiple sclerosis
CC   and/or rheumatoid arthritis. The present sequence is used in the
CC   exemplification of the invention.

PT   New isolated or purified nucleic acid associated with multiple sclerosis
PT   and/or rheumatoid arthritis, useful for detecting a virus associated with
PT   multiple sclerosis or rheumatoid arthritis in a biological sample.
XX
PS   Example 19; Fig 51A; 193pp; English.
XX
CC   The invention relates to an isolated or purified nucleic acid from a
CC   virus associated with multiple sclerosis and/or rheumatoid arthritis,
CC   multiple sclerosis-associated virus (MSRV)-1. The nucleic acids comprise
CC   pol, gag or reverse transcriptase genes (or their fragments) encoding the
CC   proteins or defined peptides (including immunodominant peptides,
CC   antigenic peptides or conserved motifs).Also included are a process for
CC   detecting a virus associated with multiple sclerosis or rheumatoid
CC   arthritis in a biological sample, a nucleic acid probe for the detection
CC   of a virus associated with multiple sclerosis or rheumatoid arthritis, a
CC   primer for the amplification by polymerisation of a nucleic acid of a
CC   viral material associated with multiple sclerosis or rheumatoid
CC   arthritis, a polypeptide exhibiting an inhibitory activity on the
CC   proteolytic, reverse transcriptase or ribonuclease H activity from MSRV,
CC   and an antibody directed against the MSRV-1 virus obtained by
CC   immunologically reacting a human or animal body or cells with an
CC   immunogenic agent consisting of the antigenic polypeptide defined above.
CC   The nucleic acids are useful for detecting a biological sample a virus
```

```
CC   associated with multiple sclerosis or rheumatoid arthritis, or for
CC   detecting in a biological sample, the presence of or exposure to a virus
CC   associated with multiple sclerosis or rheumatoid arthritis. The present
CC   sequence is an MSRV gene, gene fragment or gene consensus sequence. Note:
CC   The SEQ ID numbers for the sequences as displayed in the main body of the
CC   patent do not match the SEQ ID numbers in the sequence listing.
CC   Consequently those sequences mentioned in the claims may not be the
CC   sequences the authors intended to claim.

PT New isolated or purified nucleic acid associated with multiple sclerosis
PT and/or rheumatoid arthritis, useful for detecting a virus associated with
PT multiple sclerosis or rheumatoid arthritis in a biological sample.
XX
PS Claim 31; Page 77-78; 193pp; English.
XX
CC The invention relates to an isolated or purified nucleic acid from a
CC virus associated with multiple sclerosis and/or rheumatoid arthritis,
CC multiple sclerosis-associated virus (MSRV)-1. The nucleic acids comprise
CC pol, gag or reverse transcriptase genes (or their fragments) encoding the
CC proteins or defined peptides (including immunodominant peptides,
CC antigenic peptides or conserved motifs).Also included are a process for
CC detecting a virus associated with multiple sclerosis or rheumatoid
CC arthritis in a biological sample, a nucleic acid probe for the detection
CC of a virus associated with multiple sclerosis or rheumatoid arthritis, a
CC primer for the amplification by polymerisation of a nucleic acid of a
CC viral material associated with multiple sclerosis or rheumatoid
CC arthritis, a polypeptide exhibiting an inhibitory activity on the
CC proteolytic, reverse transcriptase or ribonuclease H activity from MSRV,
CC and an antibody directed against the MSRV-1 virus obtained by
CC immunologically reacting a human or animal body or cells with an
CC immunogenic agent consisting of the antigenic polypeptide defined above.
CC The nucleic acids are useful for detecting a biological sample a virus
CC associated with multiple sclerosis or rheumatoid arthritis, or for
CC detecting in a biological sample, the presence of or exposure to a virus
CC associated with multiple sclerosis or rheumatoid arthritis. The present
CC sequence is a claimed MSRV-associated sequence whose identity cannot be
CC accurately determined. Note: The SEQ ID numbers for the sequences as
CC displayed in the main body of the patent do not match the SEQ ID numbers
CC in the sequence listing. Consequently those sequences mentioned in the
CC claims may not be the sequences the authors intended to claim.

PT New isolated or purified nucleic acid associated with multiple sclerosis
PT and/or rheumatoid arthritis, useful for detecting a virus associated with
PT multiple sclerosis or rheumatoid arthritis in a biological sample.
XX
PS Example 19; Fig 51A; 193pp; English.
XX
CC The invention relates to an isolated or purified nucleic acid from a
CC virus associated with multiple sclerosis and/or rheumatoid arthritis,
CC multiple sclerosis-associated virus (MSRV)-1. The nucleic acids comprise
CC pol, gag or reverse transcriptase genes (or their fragments) encoding the
CC proteins or defined peptides (including immunodominant peptides,
CC antigenic peptides or conserved motifs).Also included are a process for
CC detecting a virus associated with multiple sclerosis or rheumatoid
CC arthritis in a biological sample, a nucleic acid probe for the detection
CC of a virus associated with multiple sclerosis or rheumatoid arthritis, a
CC primer for the amplification by polymerisation of a nucleic acid of a
CC viral material associated with multiple sclerosis or rheumatoid
CC arthritis, a polypeptide exhibiting an inhibitory activity on the
CC proteolytic, reverse transcriptase or ribonuclease H activity from MSRV,
CC and an antibody directed against the MSRV-1 virus obtained by
CC immunologically reacting a human or animal body or cells with an
CC immunogenic agent consisting of the antigenic polypeptide defined above.
CC The nucleic acids are useful for detecting a biological sample a virus
CC associated with multiple sclerosis or rheumatoid arthritis, or for
CC detecting in a biological sample, the presence of or exposure to a virus
CC associated with multiple sclerosis or rheumatoid arthritis. The present
CC sequence is an MSRV gene, gene fragment or gene consensus sequence. Note:
CC The SEQ ID numbers for the sequences as displayed in the main body of the
CC patent do not match the SEQ ID numbers in the sequence listing.
CC Consequently those sequences mentioned in the claims may not be the
CC sequences the authors intended to claim.

PT   New isolated polynucleotide and encoded polypeptides, useful in
PT   diagnostics, forensics, gene mapping, identification of mutations
PT   responsible for genetic disorders or other traits and to assess
PT   biodiversity.
XX
PS   Claim 1; SEQ ID NO 12263; 103pp; English.
XX
CC   The invention relates to isolated polynucleotide (I) and polypeptide (II)
CC   sequences. (I) is useful as hybridisation probes, polymerase chain
CC   reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
CC   and in recombinant production of (II). The polynucleotides are also used
CC   in diagnostics as expressed sequence tags for identifying expressed
CC   genes. (I) is useful in gene therapy techniques to restore normal
CC   activity of (II) or to treat disease states involving (II). (II) is
CC   useful for generating antibodies against it, detecting or quantitating a
CC   polypeptide in tissue, as molecular weight markers and as a food
CC   supplement. (II) and its binding partners are useful in medical imaging
CC   of sites expressing (II). (I) and (II) are useful for treating disorders
CC   involving aberrant protein expression or biological activity. The
CC   polypeptide and polynucleotide sequences have applications in
CC   diagnostics, forensics, gene mapping, identification of mutations
CC   responsible for genetic disorders or other traits to assess biodiversity
CC   and to produce other types of data and products dependent on DNA and
CC   amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
CC   coding sequences of the invention. Note: The sequence data for this
CC   patent did not appear in the printed specification, but was obtained in
CC   electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

XX
CC   The invention relates to isolated polynucleotide (I) and polypeptide (II)
CC   sequences. (I) is useful as hybridisation probes, polymerase chain
CC   reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
CC   and in recombinant production of (II). The polynucleotides are also used
CC   in diagnostics as expressed sequence tags for identifying expressed
CC   genes. (I) is useful in gene therapy techniques to restore normal
CC   activity of (II) or to treat disease states involving (II). (II) is
CC   useful for generating antibodies against it, detecting or quantitating a
CC   polypeptide in tissue, as molecular weight markers and as a food
CC   supplement. (II) and its binding partners are useful in medical imaging
CC   of sites expressing (II). (I) and (II) are useful for treating disorders
CC   involving aberrant protein expression or biological activity. The
CC   polypeptide and polynucleotide sequences have applications in
CC   diagnostics, forensics, gene mapping, identification of mutations
CC   responsible for genetic disorders or other traits to assess biodiversity
CC   and to produce other types of data and products dependent on DNA and
CC   amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
CC   coding sequences of the invention. Note: The sequence data for this
CC   patent did not appear in the printed specification, but was obtained in
CC   electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PT New nucleic acid sequences from human endogenous retrovirus-W - expressed
PT exclusively in placenta and useful in diagnosis and therapy of autoimmune
PT disease, and abnormal or failed pregnancy.
XX
PS Claim 1; Page 48-49; 106pp; French.
XX
CC This sequence represents clone cl.6A2 of the human endogenous retrovirus
CC (HERV) W genome. The nucleic acids, their fragments or peptides encoded
CC by them are markers of autoimmune disease (e.g. multiple sclerosis,
CC rheumatoid polyarthritis, disseminated lupus erythematosus, insulin-
CC dependent diabetes and related pathologies) and of abnormal or
CC unsuccessful pregnancy and can be used as chromosomal markers for
CC susceptibility to these conditions, or proximity markers of genes
CC associated with this susceptibility

PT   at least part of the gag gene.
XX
PS   Disclosure; Page 42-43; 53pp; French.
XX
CC   The present sequence represents an endogenetic retroviral nucleic acid
CC   fragment, which is associated with an autoimmune disease, and is
CC   integrated into the human genome. The fragment is originally derived from
CC   a novel retrovirus, human endogenous retrovirus W (HERV-W). The HERV-W
CC   retrovirus is associated with autoimmune disease, failure of pregnancy or
CC   disorders of pregnancy. The nucleic acid fragment, or proteins derived
CC   from it, are useful for diagnosis of autoimmune disease (specifically
CC   multiple sclerosis) and for monitoring pregnancy. The nucleic acid
CC   fragments may also be used for in situ labelling of isolated chromosomes,
CC   while the transcription product can be used to study or monitor T cell
CC   proliferation in vitro

PT   Human genome-derived single exon nucleic acid probes useful for analyzing
PT   gene expression in human cervical epithelial cells.
XX
PS   Claim 25; SEQ ID NO 9217; 487pp; English.
XX
CC   The present invention relates to human single exon nucleic acid probes
CC   (SENP). The present sequence is one such probe. The SENPs are derived
CC   from human HeLa cells. The SENPs can be used to produce a single exon
CC   microarray, which can be used for measuring human gene expression in a
CC   sample derived from human cervical epithelial cells. By measuring gene
CC   expression, the probes are therefore useful in grading and/or staging of
CC   diseases of the cervix, notably cervical cancer. Note: The sequence data
CC   for this patent did not form part of the printed specification, but was
CC   obtained in electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

XX
CC   The invention relates to a single exon nucleic acid probe for measuring
CC   human gene expression in a sample derived from human foetal liver. The
CC   single exon nucleic acid probes may be used for predicting, measuring and
CC   displaying gene expression in samples derived from human fetal liver. The
CC   present sequence is a single exon nucleic acid probe of the invention.
CC   Note: The sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO

PT Human genome-derived single exon nucleic acid probes useful for analyzing
PT gene expression in human adult liver.
XX
PS Claim 1; SEQ ID NO 13060; 658pp; English.
XX
CC The invention relates to a single exon nucleic acid probe (SENP) (I) for
CC measuring human gene expression in a sample derived from human adult
CC liver, comprising one of 13109 defined nucleotide sequences given in the
CC specification (or complements/ fragments). The probe hybridises at high
CC stringency to a nucleic acid molecule expressed in the human adult liver.
CC (I) may be used for predicting, measuring and displaying gene expression
CC in samples derived from human adult liver. The genes identified may be
CC involved in genetic liver diseases such as cirrhosis,
CC hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is
CC associated with coronary heart disease. ABS25011-ABS51005 represent human
CC liver single exon nucleic acid probes of the invention. Note: The
CC sequence information for this patent does not appear in the printed
CC specification but was obtained in electronic format directly from WIPO at
CC ftp.wipo.int/pub/published_pct_sequences

PT Spatially-addressable set of single exon nucleic acid probes, used to
PT measure gene expression in human lung samples.
XX
PS Claim 1; SEQ ID NO 12541; 634pp; English.
XX
CC The invention relates to a spatially-addressable set of single exon
CC nucleic acid probes for measuring gene expression in a sample derived
CC from human lung comprising single exon nucleic acid probes having one of
CC 12614 nucleic acid sequences mentioned in the specification, or their
CC complements or the 12387 open reading frames derived from the 12614
CC probes. Also included are a microarray comprising the novel set of probes
CC ; the novel set of probes which hybridise at high stringency to a nucleic
CC acid expressed in the human lung; measuring gene expression in a sample
CC derived from human lung, comprising (a) contacting the array with a
CC collection of detectably labeled nucleic acids derived from human lung
CC mRNA, and (b) measuring the label detectably bound to each probe of the
CC array; identifying exons in a eukaryotic genome, comprising (a)
CC algorithmically predicting at least one exon from genomic sequences of
CC the eukaryote; and (b) detecting specific hybridisation of detectably
CC labeled nucleic acids from eukaryote lung mRNA, to a single exon probe,
CC having a fragment identical to the predicted exon, the probe is included
CC in the above mentioned microarray; assigning exons to a single gene,
CC comprising (a) identifying exons from genomic sequence by the method
CC above and (b) measuring the expression of each of the exons in several
CC tissues and/or cell types using hybridisation to a single exon
CC microarrays having a probe with the exon, where a common pattern of
CC expression of the exons in the tissues and/or cell types indicates that
CC the exons should be assigned to a single gene; a peptide comprising one
CC of 12011 sequences, mentioned in the specification, or encoded by the
CC probes/open reading frames (ORF). The probes are used for gene expression
CC analysis, and for identifying exons in a gene, particularly using human
CC lung derived mRNA and for the study of lung diseases such as asthma, lung
CC cancer, chronic obstructive pulmonary disease (COPD), interstitial lung
CC disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis,
CC tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-
CC Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary
CC histiocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis,
CC Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary
CC dyskinesis, pulmonary hypertension and hyaline membrane disease. The
CC present sequence is a single exon probe of the invention. Note: The
CC sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from WIPO
CC at ftp.wipo.int/pub/published_pct_sequences

PT   New nucleic acid sequences of human endogenous retrovirus, HERV-7q, used
PT   for diagnosis, treatment and prevention of autoimmune and neurological
PT   diseases.
XX
PS   Claim 2; Page 129; 225pp; French.
XX
CC   The present invention relates to new nucleic acid sequences of human
CC   endogenouse retrovirus, HERV-7q, which is located on chromosome 7q.
CC   Regulatory elements associated with HERV-7q may alter expression of other
CC   genes (even remote genes) on the same chromosome, inducing immunological
CC   and/or neurological changes (which may be pathological or protective/
CC   curative). HERV-7q peptides can be used to improve efficiency of the
CC   immune response, e.g. in immunotherapy. HERV-7q peptides and their coding
CC   sequences can be used in immunogenic or vaccinating compositions, for
CC   protection against autoimmune diseases, particularly multiple sclerosis.
CC   The peptides may also be used (by sequence comparison) to detect/identify
CC   endogenous retroviruses that are abnormally expressed in cancer,
CC   neuropathologies or other autoimmune diseases. The present sequence was
CC   used to illustrate the invention

XX
CC   The present sequence represents a multiple sclerosis (MS) associated
CC   retrovirus (MSRV) genomic fragment used in the method of the invention.
CC   The invention provides complete or partial genomic sequences of the MSRV-
CC   1 pol gene, gag gene and env gene, and polypeptides encoded by these
CC   genes. The invention also provides antibodies raised against the
CC   polypeptides. The genomic sequences, polypeptides and antibodies are also
CC   claimed useful for diagnosing infection by MS and rheumatoid arthritis-
CC   associated viruses, and also for prevention and treatment of infection
CC   with these viruses

PT  New nucleic acid from human endogenous retrovirus, useful e.g. for
PT  diagnosis of autoimmune disease and complications of pregnancy, contains
PT  at least part of the gag gene.
XX
PS  Claim 4; Page 35; 53pp; French.
XX
CC  The present sequence represents an endogenetic retroviral nucleic acid
CC  fragment, which is associated with an autoimmune disease, and is
CC  integrated into the human genome. The fragment is originally derived from
CC  a novel retrovirus, human endogenous retrovirus W (HERV-W). The fragment
CC  comprises (or consists of) at least part of the gag gene of the HERV-W
CC  retrovirus, which is associated with either autoimmune disease, failure
CC  of pregnancy or disorders of pregnancy. The nucleic acid fragment, or
CC  proteins derived from it, are useful for diagnosis of autoimmune disease
CC  (specifically multiple sclerosis) and for monitoring pregnancy. The
CC  nucleic acid fragments may also be used for in situ labelling of isolated
CC  chromosomes, while the transcription product can be used to study or
CC  monitor T cell proliferation in vitro

PT   New isolated nucleic acid and their fragments having the pol gene of a
PT   retrovirus, useful for diagnosing, preventing and/or treating multiple
PT   sclerosis and/or rheumatoid arthritis.
XX
PS   Disclosure; SEQ ID NO 117; 193pp; English.
XX
CC   The invention relates to an isolated nucleic acid which comprises the pol
CC   gene of a retrovirus associated with multiple sclerosis or rheumatoid
CC   arthritis. The methods and compositions of the present invention are
CC   useful for diagnosing, preventing and/or treating multiple sclerosis
CC   and/or rheumatoid arthritis. The present sequence is used in the
CC   exemplification of the invention.

XX
CC   This sequence represents clone cl.C4C5 of the human endogenous retrovirus
CC   (HERV) W genome. The nucleic acids, their fragments or peptides encoded
CC   by them are markers of autoimmune disease (e.g. multiple sclerosis,
CC   rheumatoid polyarthritis, disseminated lupus erythematosus, insulin-
CC   dependent diabetes and related pathologies) and of abnormal or
CC   unsuccessful pregnancy and can be used as chromosomal markers for
CC   susceptibility to these conditions, or proximity markers of genes
CC   associated with this susceptibility

PT   New nucleic acid from human endogenous retrovirus, useful e.g. for
PT   diagnosis of autoimmune disease and complications of pregnancy, contains
PT   at least part of the gag gene.
XX
PS   Disclosure; Page 46; 53pp; French.
XX
CC   The present sequence represents an endogenetic retroviral nucleic acid
CC   fragment, which is associated with an autoimmune disease, and is
CC   integrated into the human genome. The fragment is originally derived from
CC   a novel retrovirus, human endogenous retrovirus W (HERV-W). The HERV-W
CC   retrovirus is associated with autoimmune disease, failure of pregnancy or
CC   disorders of pregnancy. The nucleic acid fragment, or proteins derived
CC   from it, are useful for diagnosis of autoimmune disease (specifically
CC   multiple sclerosis) and for monitoring pregnancy. The nucleic acid
CC   fragments may also be used for in situ labelling of isolated chromosomes,
CC   while the transcription product can be used to study or monitor T cell
CC   proliferation in vitro

PT   New isolated or purified nucleic acid associated with multiple sclerosis
PT   and/or rheumatoid arthritis, useful for detecting a virus associated with
PT   multiple sclerosis or rheumatoid arthritis in a biological sample.
XX
PS   Disclosure; Page 83-84; 193pp; English.
XX
CC   The invention relates to an isolated or purified nucleic acid from a
CC   virus associated with multiple sclerosis and/or rheumatoid arthritis,
CC   multiple sclerosis-associated virus (MSRV)-1. The nucleic acids comprise
CC   pol, gag or reverse transcriptase genes (or their fragments) encoding the
CC   proteins or defined peptides (including immunodominant peptides,
CC   antigenic peptides or conserved motifs).Also included are a process for
CC   detecting a virus associated with multiple sclerosis or rheumatoid
CC   arthritis in a biological sample, a nucleic acid probe for the detection
CC   of a virus associated with multiple sclerosis or rheumatoid arthritis, a
CC   primer for the amplification by polymerisation of a nucleic acid of a
CC   viral material associated with multiple sclerosis or rheumatoid
CC   arthritis, a polypeptide exhibiting an inhibitory activity on the
CC   proteolytic, reverse transcriptase or ribonuclease H activity from MSRV,
CC   and an antibody directed against the MSRV-1 virus obtained by
CC   immunologically reacting a human or animal body or cells with an
CC   immunogenic agent consisting of the antigenic polypeptide defined above.
CC   The nucleic acids are useful for detecting a biological sample a virus
CC   associated with multiple sclerosis or rheumatoid arthritis, or for
CC   detecting in a biological sample, the presence of or exposure to a virus
CC   associated with multiple sclerosis or rheumatoid arthritis. The present
CC   sequence is an MSRV-associated sequence whose identity cannot be
CC   accurately determined. Note: The SEQ ID numbers for the sequences as
CC   displayed in the main body of the patent do not match the SEQ ID numbers
CC   in the sequence listing. Consequently those sequences mentioned in the
CC   claims may not be the sequences the authors intended to claim.

PT   New nucleic acid sequences of human endogenous retrovirus, HERV-7q, used
PT   for diagnosis, treatment and prevention of autoimmune and neurological
PT   diseases.
XX
PS   Claim 3; Page 148-150; 225pp; French.
XX
CC   The present invention relates to new nucleic acid sequences of human
CC   endogenouse retrovirus, HERV-7q, which is located on chromosome 7q.
CC   Regulatory elements associated with HERV-7q may alter expression of other
CC   genes (even remote genes) on the same chromosome, inducing immunological
CC   and/or neurological changes (which may be pathological or protective/
CC   curative). HERV-7q peptides can be used to improve efficiency of the
CC   immune response, e.g. in immunotherapy. HERV-7q peptides and their coding
CC   sequences can be used in immunogenic or vaccinating compositions, for
CC   protection against autoimmune diseases, particularly multiple sclerosis.
CC   The peptides may also be used (by sequence comparison) to detect/identify
CC   endogenous retroviruses that are abnormally expressed in cancer,
CC   neuropathologies or other autoimmune diseases. The present sequence was
CC   used to illustrate the invention

PT New viral material and nucleotide fragments associated with multiple
PT sclerosis and rheumatoid arthritis - also related peptide(s) and
PT antibodies, used for diagnosis, treatment and as vaccines.
XX
PS Claim 1; Page 112-113; 188pp; French.
XX
CC Sequences AAT96468-77 represent claimed nucleic acid sequences derived
CC from the multiple sclerosis related virus 1 (MSRV-1), especially from the
CC env, pol and part of the gag gene region, but exclude the sub-region
CC represented by AAT96527. This sequence is from clone FP6 and is
CC especially from the pol gene region. The sequence was isolated PCR using
CC primers AAT96558-60. The above sequences are associated with multiple
CC sclerosis and some are also associated with rheumatoid arthritis. Nucleic
CC acid sequences from this virus can be used in the diagnosis of multiple
CC sclerosis and rheumatoid arthritis

PT New nucleic acid from retroviruses - useful for diagnosis, prevention and
PT treatment of, e.g. multiple sclerosis.
XX
PS Example 14; Fig 38; 286pp; English.
XX
CC The present sequence represents the multiple sclerosis (MS) associated
CC retrovirus (MSRV) clone FP6 DNA sequence containing a portion of the pol
CC gene. The invention provides complete or partial genomic sequences of the
CC MSRV-1 pol gene, gag gene and env gene, and polypeptides encoded by these
CC genes. The invention also provides antibodies raised against the
CC polypeptides. The genomic sequences, polypeptides and antibodies are also
CC claimed useful for diagnosing infection by MS and rheumatoid arthritis-
CC associated viruses, and also for the prevention and treatment of
CC infection with these viruses

PT New isolated or purified nucleic acid associated with multiple sclerosis
PT and/or rheumatoid arthritis, useful for detecting a virus associated with
PT multiple sclerosis or rheumatoid arthritis in a biological sample.
XX
PS Example 14; Fig 38; 193pp; English.
XX
CC The invention relates to an isolated or purified nucleic acid from a
CC virus associated with multiple sclerosis and/or rheumatoid arthritis,
CC multiple sclerosis-associated virus (MSRV)-1. The nucleic acids comprise
CC pol, gag or reverse transcriptase genes (or their fragments) encoding the
CC proteins or defined peptides (including immunodominant peptides,
CC antigenic peptides or conserved motifs).Also included are a process for
CC detecting a virus associated with multiple sclerosis or rheumatoid
CC arthritis in a biological sample, a nucleic acid probe for the detection
CC of a virus associated with multiple sclerosis or rheumatoid arthritis, a
CC primer for the amplification by polymerisation of a nucleic acid of a
CC viral material associated with multiple sclerosis or rheumatoid
CC arthritis, a polypeptide exhibiting an inhibitory activity on the
CC proteolytic, reverse transcriptase or ribonuclease H activity from MSRV,
CC and an antibody directed against the MSRV-1 virus obtained by
CC immunologically reacting a human or animal body or cells with an
CC immunogenic agent consisting of the antigenic polypeptide defined above.
CC The nucleic acids are useful for detecting a biological sample a virus
CC associated with multiple sclerosis or rheumatoid arthritis, or for
CC detecting in a biological sample, the presence of or exposure to a virus
CC associated with multiple sclerosis or rheumatoid arthritis. The present
CC sequence is an MSRV cDNA clone. Note: The SEQ ID numbers for the
CC sequences as displayed in the main body of the patent do not match the
CC SEQ ID numbers in the sequence listing. Consequently those sequences
CC mentioned in the claims may not be the sequences the authors intended to
CC claim.

XX
CC   The invention relates to an isolated nucleic acid which comprises the pol
CC   gene of a retrovirus associated with multiple sclerosis or rheumatoid
CC   arthritis. The methods and compositions of the present invention are
CC   useful for diagnosing, preventing and/or treating multiple sclerosis
CC   and/or rheumatoid arthritis. The present sequence is used in the
CC   exemplification of the invention.

PT   Human genome-derived single exon nucleic acid probes useful for analyzing
PT   gene expression in human cervical epithelial cells.
XX
PS   Claim 25; SEQ ID NO 17996; 487pp; English.
XX
CC   The present invention relates to human single exon nucleic acid probes
CC   (SENP). The present sequence is one such probe. The SENPs are derived
CC   from human HeLa cells. The SENPs can be used to produce a single exon
CC   microarray, which can be used for measuring human gene expression in a
CC   sample derived from human cervical epithelial cells. By measuring gene
CC   expression, the probes are therefore useful in grading and/or staging of
CC   diseases of the cervix, notably cervical cancer. Note: The sequence data
CC   for this patent did not form part of the printed specification, but was
CC   obtained in electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PT   Human genome-derived single exon nucleic acid probes useful for analyzing
```

```
PT   gene expression in human adult liver.
XX
PS   Claim 4; SEQ ID NO 25586; 658pp; English.
XX
CC   The invention relates to a single exon nucleic acid probe (SENP) (I) for
CC   measuring human gene expression in a sample derived from human adult
CC   liver, comprising one of 13109 defined nucleotide sequences given in the
CC   specification (or complements/ fragments). The probe hybridises at high
CC   stringency to a nucleic acid molecule expressed in the human adult liver.
CC   (I) may be used for predicting, measuring and displaying gene expression
CC   in samples derived from human adult liver. The genes identified may be
CC   involved in genetic liver diseases such as cirrhosis,
CC   hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is
CC   associated with coronary heart disease. ABS25011-ABS51005 represent human
CC   liver single exon nucleic acid probes of the invention. Note: The
CC   sequence information for this patent does not appear in the printed
CC   specification but was obtained in electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PT   Spatially-addressable set of single exon nucleic acid probes, used to
PT   measure gene expression in human lung samples.
```

```
XX
PS   Claim 4; SEQ ID NO 24530; 634pp; English.
XX
CC   The invention relates to a spatially-addressable set of single exon
CC   nucleic acid probes for measuring gene expression in a sample derived
CC   from human lung comprising single exon nucleic acid probes having one of
CC   12614 nucleic acid sequences mentioned in the specification, or their
CC   complements or the 12387 open reading frames derived from the 12614
CC   probes. Also included are a microarray comprising the novel set of probes
CC   ; the novel set of probes which hybridise at high stringency to a nucleic
CC   acid expressed in the human lung; measuring gene expression in a sample
CC   derived from human lung, comprising (a) contacting the array with a
CC   collection of detectably labeled nucleic acids derived from human lung
CC   mRNA, and (b) measuring the label detectably bound to each probe of the
CC   array; identifying exons in a eukaryotic genome, comprising (a)
CC   algorithmically predicting at least one exon from genomic sequences of
CC   the eukaryote; and (b) detecting specific hybridisation of detectably
CC   labeled nucleic acids from eukaryote lung mRNA, to a single exon probe,
CC   having a fragment identical to the predicted exon, the probe is included
CC   in the above mentioned microarray; assigning exons to a single gene,
CC   comprising (a) identifying exons from genomic sequence by the method
CC   above and (b) measuring the expression of each of the exons in several
CC   tissues and/or cell types using hybridisation to a single exon
CC   microarrays having a probe with the exon, where a common pattern of
CC   expression of the exons in the tissues and/or cell types indicates that
CC   the exons should be assigned to a single gene; a peptide comprising one
CC   of 12011 sequences, mentioned in the specification, or encoded by the
CC   probes/open reading frames (ORF). The probes are used for gene expression
CC   analysis, and for identifying exons in a gene, particularly using human
CC   lung derived mRNA and for the study of lung diseases such as asthma, lung
CC   cancer, chronic obstructive pulmonary disease (COPD), interstitial lung
CC   disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis,
CC   tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-
CC   Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary
CC   histiocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis,
CC   Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary
CC   dyskinesis, pulmonary hypertension and hyaline membrane disease. The
CC   present sequence is a single exon probe open reading frame of the
CC   invention. Note: The sequence data for this patent did not form part of
CC   the printed specification, but was obtained in electronic format directly
CC   from WIPO at ftp.wipo.int/pub/published_pct_sequences

PT   New human genome-derived single exon nucleic acid probes useful for human
PT   gene expression analysis, for identifying or characterizing alternative
PT   splicing events, for assessing genomic alterations or as tools for
PT   surveying tissues.
XX
PS   Claim 1; SEQ ID NO 23846; 80pp; English.
XX
CC   The invention relates to a nucleic acid probe for measuring human gene
CC   expression, comprising any of the 27,400 fully defined nucleotide
CC   sequences in the specification, or their complements or fragments, and
CC   encoding at least 8 amino acids of any of the 6888 amino acid sequences
CC   fully defined in the specification. The probe is a single exon probe that
CC   hybridises under high stringency conditions to a nucleic acid molecule
CC   expressed in human cells or tissues. Also included are a spatially-
CC   addressable set of single exon nucleic acid probes for measuring human
CC   gene expression (comprising a plurality of single exon nucleic acid
CC   probes cited above, where each of the plurality of probes is separately
CC   and addressably isolatable or amplifiable from the plurality), a single
CC   exon microarray for measuring human gene expression, a method of
CC   measuring human gene expression, a vector comprising the single exon
CC   probe cited above, an ORF-encoded peptide comprising at least 8
CC   contiguous amino acids of any of the above- mentioned amino acid
CC   sequences (optionally with conservative amino acid substitutions), an
CC   isolated antibody that binds specifically to a peptide cited above,
CC   methods of selling and/or licensing single exon probes or microarrays to
CC   a customer desiring to measure gene expression, a method of providing
CC   human gene expression data by subscription, and a computer-readable
CC   storage medium which contains a database having a plurality of records
CC   (each record including data on the expression of a single exon probe
CC   cited above. The probe, methods and apparatus are useful in gene
CC   expression analysis. The probes may be used as tools for surveying
CC   tissues to detect the presence of expressed messages that contain their
CC   specific exon, or in constructing genome-derived single exon microarrays.
CC   In addition, the probes are used in identifying and characterising
CC   alternative splicing events, in detecting and characterising gross
CC   alterations in the genomic locus that includes their exon, in assessing
CC   smaller genomic alterations, in priming the synthesis of nucleic acids,
CC   or in expressing the ORF-encoded peptide. The present sequence is a human
CC   single exon probe of the invention. Note: The sequence data for this
CC   patent did not form part of the printed specification, but was obtained
CC   in electronic format directly from USPTO at
CC   seqdata.uspto.gov/sequence.html?DocID=20030194704

PT   Two pathogenic or infectious agents associated with multiple sclerosis -
PT   one being a retrovirus, useful for early diagnosis, prevention and
PT   treatment.
XX
PS   Claim 3; Page 57; 104pp; French.
XX
CC   The nucleotide sequence of the pol gene from the multiple sclerosis
CC   associated infectious agent clone designated MSRV-1. The sequence is a
CC   compilation of the sequences from other MSRV-1 clones (T022816-23). The
CC   MSRV-1 and MSRV-2 clones (T0224-6) are derived from the same strain of
CC   infectious agent, either POL2 or MS7PG or their variants, and can be
CC   produced by the same cell line, LM7PC or PLI-2 or other cell culture
CC   infected with the multiple sclerosis associated agents. The clones were
CC   isolated by extracting nucleic acids from cells of multiple sclerosis
CC   patients, converting the nucleic acid to cDNA and PCR amplifying a region
CC   of the pol gene conserved in retroviruses. The clones isolated fell into
CC   2 distinct types: one was similar to the ERV-9 and HSERV-9 endogenous
CC   retroviruses and designated MSRV-1B; the others were highly homologous to
CC   the known agent MSRV-2 and designated MSRV-2B. The nucleic acid, probes
CC   or primers derived from these sequences can be used for detecting agents
CC   associated with multiple sclerosis. The probes may be used to
CC   discriminate between these agents, opt. in conjunction with amplification
CC   primers and antibodies specific for the infectious agents

PT   LM7PC cell lines, or related nucleic acid.
XX
PS   Claim 3; Page 24; 68pp; French.
XX
CC   The invention relates to sequences isolated from members of a novel
CC   endogenous retrovirus family associated with sclerotic plaques and
CC   rheumatoid polyarthritis (RPA). The novel retroviral members are isolated
CC   from cells obtained from sclerotic plaques or synovial joint fluid from
CC   patients with RPA. Two novel strains of retrovirus are isolated: POL-2
CC   (ECACC V92072202) and MS7PG (ECACC V93010816), which are isolated from
CC   the cell lines PLI-2 and MS7PC respectively. The retroviruses were
CC   isolated from the cell lines by fractionating the cells and assaying for
CC   reverse transcriptase activity. Messenger RNA was then purified and
CC   amplified by RT-PCR using primers based on reasonably conserved sequences
CC   found in the pol genes of known exogenous and endogenous retroviruses and
CC   other viruses having reverse transcriptase activity. The resultant
CC   amplified cDNAs were cloned and sequenced. Sequence analysis separated
CC   the clones into two groups: the first has homology to the human
CC   endogenous retrovirus HSERV-9 and is designated MSRV-1B (see AAT37974-79)
CC   ; the second group has homology to the retrovirus MSRV-2A (AAT38002)
CC   isolated from LMP7 cells (from sclerotic plaques) and is designated MSRV-
CC   2B. The sequence presented here is a composite of the sequence
CC   corresponding to the pol gene from the MSRV-1 group (AAT37974-81). The
CC   sequences can be used for the diagnosis, prevention and treatment of RPA
CC   caused by infection or reactivation of the retroviruses. (Updated on 27-
CC   AUG-2003 to correct OS field.)

PT   New viral material and nucleotide fragments associated with multiple
PT   sclerosis and rheumatoid arthritis - also related peptide(s) and
PT   antibodies, used for diagnosis, treatment and as vaccines.
XX
PS   Claim 2; Fig 9; 188pp; French.
XX
CC   This is the nucleotide sequence of a region designated pol* from the
CC   multiple sclerosis related virus 1B (MSRV-1B). MSRV-1 sequences are
CC   associated with multiple sclerosis and some are also associated with
CC   rheumatoid arthritis. Nucleic acid sequences from the MSRV-1 virus can be
CC   used in the diagnosis of multiple sclerosis and rheumatoid arthritis.
CC   Note: this sequence is specifically excluded from the claimed sequences
CC   of the specification

PT   New nucleic acid from retroviruses - useful for diagnosis, prevention and
PT   treatment of, e.g. multiple sclerosis.
XX
PS   Example 5; Fig 9; 286pp; English.
XX
CC   The present sequence is representative of the multiple sclerosis (MS)
CC   associated retrovirus-1 (MSRV-1) pol gene sequence. The invention
CC   provides complete or partial genomic sequences of the MSRV-1 pol gene,
CC   gag gene and env gene, and polypeptides encoded by these genes. The
CC   invention also provides antibodies raised against the polypeptides. The
CC   genomic sequences, polypeptides and antibodies are also claimed useful
CC   for diagnosing infection by MS and rheumatoid arthritis-associated
CC   viruses, and also for prevention and treatment of infection with these
CC   viruses

PS   Example 5; Fig 9; 193pp; English.
XX
CC   The invention relates to an isolated or purified nucleic acid from a
CC   virus associated with multiple sclerosis and/or rheumatoid arthritis,
CC   multiple sclerosis-associated virus (MSRV)-1. The nucleic acids comprise
CC   pol, gag or reverse transcriptase genes (or their fragments) encoding the
CC   proteins or defined peptides (including immunodominant peptides,
CC   antigenic peptides or conserved motifs).Also included are a process for
CC   detecting a virus associated with multiple sclerosis or rheumatoid
CC   arthritis in a biological sample, a nucleic acid probe for the detection
CC   of a virus associated with multiple sclerosis or rheumatoid arthritis, a
CC   primer for the amplification by polymerisation of a nucleic acid of a
CC   viral material associated with multiple sclerosis or rheumatoid
CC   arthritis, a polypeptide exhibiting an inhibitory activity on the
CC   proteolytic, reverse transcriptase or ribonuclease H activity from MSRV,
CC   and an antibody directed against the MSRV-1 virus obtained by
CC   immunologically reacting a human or animal body or cells with an
CC   immunogenic agent consisting of the antigenic polypeptide defined above.
CC   The nucleic acids are useful for detecting a biological sample a virus
CC   associated with multiple sclerosis or rheumatoid arthritis, or for
CC   detecting in a biological sample, the presence of or exposure to a virus
CC   associated with multiple sclerosis or rheumatoid arthritis. The present
CC   sequence is an MSRV gene, gene fragment or gene consensus sequence. Note:
CC   The SEQ ID numbers for the sequences as displayed in the main body of the
CC   patent do not match the SEQ ID numbers in the sequence listing.
CC   Consequently those sequences mentioned in the claims may not be the
CC   sequences the authors intended to claim.

PS   Example 5; SEQ ID NO 1; 193pp; English.
XX
CC   The invention relates to an isolated nucleic acid which comprises the pol
CC   gene of a retrovirus associated with multiple sclerosis or rheumatoid
CC   arthritis. The methods and compositions of the present invention are
CC   useful for diagnosing, preventing and/or treating multiple sclerosis
CC   and/or rheumatoid arthritis. The present sequence is used in the
CC   exemplification of the invention.

PT   New nucleic acid sequences of human endogenous retrovirus, HERV-7q, used
PT   for diagnosis, treatment and prevention of autoimmune and neurological
PT   diseases.
XX
PS   Claim 3; Page 135; 225pp; French.
XX
CC   The present invention relates to new nucleic acid sequences of human
CC   endogenouse retrovirus, HERV-7q, which is located on chromosome 7q.
CC   Regulatory elements associated with HERV-7q may alter expression of other
CC   genes (even remote genes) on the same chromosome, inducing immunological
CC   and/or neurological changes (which may be pathological or protective/
CC   curative). HERV-7q peptides can be used to improve efficiency of the
CC   immune response, e.g. in immunotherapy. HERV-7q peptides and their coding
CC   sequences can be used in immunogenic or vaccinating compositions, for
CC   protection against autoimmune diseases, particularly multiple sclerosis.
CC   The peptides may also be used (by sequence comparison) to detect/identify
CC   endogenous retroviruses that are abnormally expressed in cancer,
CC   neuropathologies or other autoimmune diseases. The present sequence was
CC   used to illustrate the invention

PT   New isolated polynucleotide and encoded polypeptides, useful in
PT   diagnostics, forensics, gene mapping, identification of mutations
PT   responsible for genetic disorders or other traits and to assess
PT   biodiversity.
XX
PS   Claim 1; SEQ ID NO 7529; 103pp; English.
XX
CC   The invention relates to isolated polynucleotide (I) and polypeptide (II)
CC   sequences. (I) is useful as hybridisation probes, polymerase chain
CC   reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
CC   and in recombinant production of (II). The polynucleotides are also used
CC   in diagnostics as expressed sequence tags for identifying expressed
CC   genes. (I) is useful in gene therapy techniques to restore normal
CC   activity of (II) or to treat disease states involving (II). (II) is
CC   useful for generating antibodies against it, detecting or quantitating a
CC   polypeptide in tissue, as molecular weight markers and as a food
CC   supplement. (II) and its binding partners are useful in medical imaging
CC   of sites expressing (II). (I) and (II) are useful for treating disorders
CC   involving aberrant protein expression or biological activity. The
CC   polypeptide and polynucleotide sequences have applications in
CC   diagnostics, forensics, gene mapping, identification of mutations
CC   responsible for genetic disorders or other traits to assess biodiversity
CC   and to produce other types of data and products dependent on DNA and
CC   amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
CC   coding sequences of the invention. Note: The sequence data for this
CC   patent did not appear in the printed specification, but was obtained in
CC   electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PT   Human genome-derived single exon nucleic acid probes useful for analyzing
PT   gene expression in human cervical epithelial cells.
XX
PS   Claim 25; SEQ ID NO 13736; 487pp; English.
XX
CC   The present invention relates to human single exon nucleic acid probes
CC   (SENP). The present sequence is one such probe. The SENPs are derived
CC   from human HeLa cells. The SENPs can be used to produce a single exon
CC   microarray, which can be used for measuring human gene expression in a
CC   sample derived from human cervical epithelial cells. By measuring gene
CC   expression, the probes are therefore useful in grading and/or staging of
CC   diseases of the cervix, notably cervical cancer. Note: The sequence data
CC   for this patent did not form part of the printed specification, but was
CC   obtained in electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PT   New spatially-addressable set of single exon nucleic acid probes, useful
PT   for measuring gene expression in sample derived from human breast,
PT   comprises number of single exon nucleic acid probes.
XX
PS   Claim 4; SEQ ID NO 9635; 327pp + Sequence Listing; English.
XX
CC   The invention relates to a spatially-addressable set of single exon
CC   nucleic acid probes for measuring gene expression in a sample derived
CC   from human breast and BT 474 cells. The method involves contacting the
CC   probes with a collection of detectably labelled nucleic acids derived
CC   from mRNA of human breast, and then measuring the label bound to each
CC   probe of the microarray. The probes are useful for verifying the
CC   expression of regions of genomic DNA predicted to encode proteins. They
CC   are useful for gene discovery, and for determining predisposition and/or
CC   prognosing breast disease. Gene expression analysis is useful for
CC   assessing the toxicity of chemical agents on cells. The microarray of
CC   this invention presents a far greater diversity of probes for measuring
CC   gene expression, with far less bias than expressed sequence tag
CC   microarrays. The method is suitable for rapid production of functional
CC   information from genomic sequence. The present sequence is a single exon
CC   nucleic acid probe of the invention. Note: The sequence data for this
CC   patent did not form part of the printed specification, but was obtained
CC   in electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

```

```
CC   The present invention provides a number of single exon nucleic acid
CC   probes which are derived from genomic sequences expressed in the human
CC   bone marrow. They can be used to measure gene expression in bone marrow
CC   samples, which may enable the improved diagnosis and treatment of cancers
CC   such as lymphoma, leukaemia and myeloma. The present sequence is one of
CC   the probes of the invention

PT   Human genome-derived single exon nucleic acid probes useful for analyzing
PT   gene expression in human adult liver.
XX
PS   Claim 4; SEQ ID NO 17665; 658pp; English.
XX
CC   The invention relates to a single exon nucleic acid probe (SENP) (I) for
CC   measuring human gene expression in a sample derived from human adult
CC   liver, comprising one of 13109 defined nucleotide sequences given in the
CC   specification (or complements/ fragments). The probe hybridises at high
CC   stringency to a nucleic acid molecule expressed in the human adult liver.
CC   (I) may be used for predicting, measuring and displaying gene expression
CC   in samples derived from human adult liver. The genes identified may be
CC   involved in genetic liver diseases such as cirrhosis,
CC   hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is
CC   associated with coronary heart disease. ABS25011-ABS51005 represent human
CC   liver single exon nucleic acid probes of the invention. Note: The
CC   sequence information for this patent does not appear in the printed
CC   specification but was obtained in electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PT   Novel single exon nucleic acid probe used to measuring gene expression in
PT   a human breast.
XX
PS   Claim 25; SEQ ID NO 9403; 322pp; English.
XX
CC   The present invention relates to novel single exon nucleic acid probes.
CC   The present sequence is one such probe. The probes are useful for
CC   measuring human gene expression in a human breast sample, where the probe
CC   hybridises at high stringency to a nucleic acid expressed in the human
CC   breast. The probes are useful for predicting, diagnosing, grading,
CC   staging, monitoring and prognosing diseases of the human breast,
CC   particularly those diseases with polygenic aetiology. The diseases
CC   include: breast cancer, disorders of development, inflammatory diseases
CC   of the breast, fibrocystic changes, proliferative breast disease and non-
CC   carcinoma tumours. Note: The sequence data for this patent did not form
CC   part of the printed specification, but was obtained in electronic format
CC   directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

PT   Spatially-addressable set of single exon nucleic acid probes, used to
PT   measure gene expression in human lung samples.
XX
PS   Claim 4; SEQ ID NO 17096; 634pp; English.
XX
CC   The invention relates to a spatially-addressable set of single exon
CC   nucleic acid probes for measuring gene expression in a sample derived
CC   from human lung comprising single exon nucleic acid probes having one of
CC   12614 nucleic acid sequences mentioned in the specification, or their
CC   complements or the 12387 open reading frames derived from the 12614
CC   probes. Also included are a microarray comprising the novel set of probes
CC   ; the novel set of probes which hybridise at high stringency to a nucleic
CC   acid expressed in the human lung; measuring gene expression in a sample
CC   derived from human lung, comprising (a) contacting the array with a
CC   collection of detectably labeled nucleic acids derived from human lung
CC   mRNA, and (b) measuring the label detectably bound to each probe of the
CC   array; identifying exons in a eukaryotic genome, comprising (a)
CC   algorithmically predicting at least one exon from genomic sequences of
CC   the eukaryote; and (b) detecting specific hybridisation of detectably
CC   labeled nucleic acids from eukaryote lung mRNA, to a single exon probe,
CC   having a fragment identical to the predicted exon, the probe is included
CC   in the above mentioned microarray; assigning exons to a single gene,
CC   comprising (a) identifying exons from genomic sequence by the method
CC   above and (b) measuring the expression of each of the exons in several
CC   tissues and/or cell types using hybridisation to a single exon
CC   microarrays having a probe with the exon, where a common pattern of
CC   expression of the exons in the tissues and/or cell types indicates that
CC   the exons should be assigned to a single gene; a peptide comprising one
CC   of 12011 sequences, mentioned in the specification, or encoded by the
CC   probes/open reading frames (ORF). The probes are used for gene expression
CC   analysis, and for identifying exons in a gene, particularly using human
CC   lung derived mRNA and for the study of lung diseases such as asthma, lung
CC   cancer, chronic obstructive pulmonary disease (COPD), interstitial lung
CC   disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis,
CC   tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-
CC   Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary
CC   histiocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis,
CC   Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary
CC   dyskinesis, pulmonary hypertension and hyaline membrane disease. The
CC   present sequence is a single exon probe open reading frame of the
CC   invention. Note: The sequence data for this patent did not form part of
CC   the printed specification, but was obtained in electronic format directly
CC   from WIPO at ftp.wipo.int/pub/published_pct_sequences

XX
PS   Claim 25; SEQ ID NO 8891; 487pp; English.
XX
CC   The present invention relates to human single exon nucleic acid probes
CC   (SENP). The present sequence is one such probe. The SENPs are derived
CC   from human HeLa cells. The SENPs can be used to produce a single exon
CC   microarray, which can be used for measuring human gene expression in a
CC   sample derived from human cervical epithelial cells. By measuring gene
CC   expression, the probes are therefore useful in grading and/or staging of
CC   diseases of the cervix, notably cervical cancer. Note: The sequence data
CC   for this patent did not form part of the printed specification, but was
CC   obtained in electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PT   Human genome-derived single exon nucleic acid probes useful for analyzing
PT   gene expression in human adult liver.
XX
PS   Claim 1; SEQ ID NO 12784; 658pp; English.
XX
CC   The invention relates to a single exon nucleic acid probe (SENP) (I) for
CC   measuring human gene expression in a sample derived from human adult
CC   liver, comprising one of 13109 defined nucleotide sequences given in the
CC   specification (or complements/ fragments). The probe hybridises at high
CC   stringency to a nucleic acid molecule expressed in the human adult liver.
CC   (I) may be used for predicting, measuring and displaying gene expression
CC   in samples derived from human adult liver. The genes identified may be
CC   involved in genetic liver diseases such as cirrhosis,
CC   hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is
CC   associated with coronary heart disease. ABS25011-ABS51005 represent human
CC   liver single exon nucleic acid probes of the invention. Note: The
CC   sequence information for this patent does not appear in the printed
CC   specification but was obtained in electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PT   Spatially-addressable set of single exon nucleic acid probes, used to
PT   measure gene expression in human lung samples.
XX
PS   Claim 1; SEQ ID NO 12192; 634pp; English.
XX
CC   The invention relates to a spatially-addressable set of single exon
CC   nucleic acid probes for measuring gene expression in a sample derived
CC   from human lung comprising single exon nucleic acid probes having one of
CC   12614 nucleic acid sequences mentioned in the specification, or their
CC   complements or the 12387 open reading frames derived from the 12614
CC   probes. Also included are a microarray comprising the novel set of probes
CC   ; the novel set of probes which hybridise at high stringency to a nucleic
CC   acid expressed in the human lung; measuring gene expression in a sample
CC   derived from human lung, comprising (a) contacting the array with a
CC   collection of detectably labeled nucleic acids derived from human lung
CC   mRNA, and (b) measuring the label detectably bound to each probe of the
CC   array; identifying exons in a eukaryotic genome, comprising (a)
CC   algorithmically predicting at least one exon from genomic sequences of
CC   the eukaryote; and (b) detecting specific hybridisation of detectably
CC   labeled nucleic acids from eukaryote lung mRNA, to a single exon probe,
CC   having a fragment identical to the predicted exon, the probe is included
CC   in the above mentioned microarray; assigning exons to a single gene,
CC   comprising (a) identifying exons from genomic sequence by the method
CC   above and (b) measuring the expression of each of the exons in several
CC   tissues and/or cell types using hybridisation to a single exon
CC   microarrays having a probe with the exon, where a common pattern of
CC   expression of the exons in the tissues and/or cell types indicates that
CC   the exons should be assigned to a single gene; a peptide comprising one
CC   of 12011 sequences, mentioned in the specification, or encoded by the
CC   probes/open reading frames (ORF). The probes are used for gene expression
CC   analysis, and for identifying exons in a gene, particularly using human
CC   lung derived mRNA and for the study of lung diseases such as asthma, lung
CC   cancer, chronic obstructive pulmonary disease (COPD), interstitial lung
CC   disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis,
CC   tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-
CC   Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary
```

```
CC   histiocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis,
CC   Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary
CC   dyskinesis, pulmonary hypertension and hyaline membrane disease. The
CC   present sequence is a single exon probe of the invention. Note: The
CC   sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/published_pct_sequences

PT   New isolated polynucleotide and encoded polypeptides, useful in
PT   diagnostics, forensics, gene mapping, identification of mutations
PT   responsible for genetic disorders or other traits and to assess
PT   biodiversity.
XX
PS   Claim 1; SEQ ID NO 8028; 103pp; English.
XX
CC   The invention relates to isolated polynucleotide (I) and polypeptide (II)
CC   sequences. (I) is useful as hybridisation probes, polymerase chain
CC   reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
CC   and in recombinant production of (II). The polynucleotides are also used
CC   in diagnostics as expressed sequence tags for identifying expressed
CC   genes. (I) is useful in gene therapy techniques to restore normal
CC   activity of (II) or to treat disease states involving (II). (II) is
CC   useful for generating antibodies against it, detecting or quantitating a
CC   polypeptide in tissue, as molecular weight markers and as a food
CC   supplement. (II) and its binding partners are useful in medical imaging
CC   of sites expressing (II). (I) and (II) are useful for treating disorders
CC   involving aberrant protein expression or biological activity. The
CC   polypeptide and polynucleotide sequences have applications in
CC   diagnostics, forensics, gene mapping, identification of mutations
CC   responsible for genetic disorders or other traits to assess biodiversity
CC   and to produce other types of data and products dependent on DNA and
CC   amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
CC   coding sequences of the invention. Note: The sequence data for this
CC   patent did not appear in the printed specification, but was obtained in
CC   electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PT   Two pathogenic or infectious agents associated with multiple sclerosis -
PT   one being a retrovirus, useful for early diagnosis, prevention and
PT   treatment.
XX
PS   Claim 3; Page 59-60; 104pp; French.
XX
CC   The partial nucleotide sequence of the pol gene from the multiple
CC   sclerosis associated infectious agent clone designated MSRV-1B PSJ-17.
CC   The MSRV-1B (AAT02815-23) and MSRV-2 clones (AAT02824-6) are derived from
CC   the same strain of infectious agent, either POL2 or MS7PG or their
CC   variants, and can be produced by the same cell line, LM7PC or PLI-2 or
CC   other cell culture infected with the multiple sclerosis associated
CC   agents. The clones were isolated by extracting nucleic acids from cells
CC   of multiple sclerosis patients, converting the nucleic acid to cDNA and
CC   PCR amplifying a region of the pol gene conserved in retroviruses. The
CC   clones isolated fell into 2 distinct types: one was similar to the ERV-9
CC   and HSERV-9 endogenous retroviruses and designated MSRV-1B; the others
CC   were highly homologous to the known agent MSRV-2 and designated MSRV-2B.
CC   The nucleic acid, probes or primers derived from these sequences can be
CC   used for detecting agents associated with multiple sclerosis. The probes
CC   may be used to discriminate between these agents, opt. in conjunction
CC   with amplification primers and antibodies specific for the infectious
CC   agents

PT   Diagnosis, treatment and prevention of rheumatoid polyarthritis - using
PT   retroviral or other pathogenic or infectious material from the PLI-2 or
PT   LM7PC cell lines, or related nucleic acid.
XX
PS   Claim 3; Page 27; 68pp; French.
XX
CC   The invention relates to sequences isolated from members of a novel
CC   endogenous retrovirus family associated with sclerotic plaques and
CC   rheumatoid polyarthritis (RPA). The novel retroviral members are isolated
CC   from cells obtained from sclerotic plaques or synovial joint fluid from
CC   patients with RPA. Two novel strains of retrovirus are isolated: POL-2
CC   (ECACC V92072202) and MS7PG (ECACC V93010816), which are isolated from
CC   the cell lines PLI-2 and MS7PC respectively. This sequence is clone clone
CC   PSJ17 which corresponds a fragment of the pol gene from the viruses. The
CC   clone was isolated using the endogenous reverse transcriptase activity of
CC   virions isolated from PLI-2 cells to generate cDNA from mRNA purified
CC   from PLI-2 cells. The viral sequences can be used for the diagnosis,
CC   prevention and treatment of RPA caused by infection or reactivation of
CC   the retroviruses. (Updated on 27-AUG-2003 to correct OS field.)

CC   This is the sequence represents a fragment of the genome from the
CC   multiple sclerosis related virus 1B (MSRV-1B), isolated using an
CC   endogenous reverse transcriptase assay to isolate endogenous
CC   retroviruses. The sequence was isolated from the cell line PLI-2 derived
CC   from patients with multiple sclerosis. Sequence analysis shows that this
CC   sequence has homology to certain known retroviral elements, especially
CC   the endogenous human ERV-9 retrovirus. MSRV-1 sequences are associated
CC   with multiple sclerosis and some are also associated with rheumatoid
CC   arthritis. Nucleic acid sequences from the MSRV-1 virus can be used in
CC   the diagnosis of multiple sclerosis and rheumatoid arthritis

PS   Example 3; Fig 6; 286pp; English.
XX
CC   The present sequence represents the multiple sclerosis (MS) associated
CC   retrovirus-1 (MSRV-1) clone PSJ17 DNA sequence. The invention provides
CC   complete or partial genomic sequences of the MSRV-1 pol gene, gag gene
CC   and env gene, and polypeptides encoded by these genes. The invention also
CC   provides antibodies raised against the polypeptides. The genomic
CC   sequences, polypeptides and antibodies are also claimed useful for
CC   diagnosing infection by MS and rheumatoid arthritis-associated viruses,
CC   and also for prevention and treatment of infection with these viruses

PT   New isolated or purified nucleic acid associated with multiple sclerosis
PT   and/or rheumatoid arthritis, useful for detecting a virus associated with
PT   multiple sclerosis or rheumatoid arthritis in a biological sample.
XX
PS   Example 3; Fig 6; 193pp; English.
XX
CC   The invention relates to an isolated or purified nucleic acid from a
CC   virus associated with multiple sclerosis and/or rheumatoid arthritis,
CC   multiple sclerosis-associated virus (MSRV)-1. The nucleic acids comprise
CC   pol, gag or reverse transcriptase genes (or their fragments) encoding the
CC   proteins or defined peptides (including immunodominant peptides,
CC   antigenic peptides or conserved motifs).Also included are a process for
CC   detecting a virus associated with multiple sclerosis or rheumatoid
CC   arthritis in a biological sample, a nucleic acid probe for the detection
CC   of a virus associated with multiple sclerosis or rheumatoid arthritis, a
CC   primer for the amplification by polymerisation of a nucleic acid of a
CC   viral material associated with multiple sclerosis or rheumatoid
CC   arthritis, a polypeptide exhibiting an inhibitory activity on the
CC   proteolytic, reverse transcriptase or ribonuclease H activity from MSRV,
CC   and an antibody directed against the MSRV-1 virus obtained by
CC   immunologically reacting a human or animal body or cells with an
CC   immunogenic agent consisting of the antigenic polypeptide defined above.
CC   The nucleic acids are useful for detecting a biological sample a virus
CC   associated with multiple sclerosis or rheumatoid arthritis, or for
CC   detecting in a biological sample, the presence of or exposure to a virus
CC   associated with multiple sclerosis or rheumatoid arthritis. The present
CC   sequence is an MSRV cDNA clone. Note: The SEQ ID numbers for the
CC   sequences as displayed in the main body of the patent do not match the
CC   SEQ ID numbers in the sequence listing. Consequently those sequences
CC   mentioned in the claims may not be the sequences the authors intended to
CC   claim.

CC   The present sequence represents a multiple sclerosis (MS) associated
CC   retrovirus (MSRV) genomic fragment used in the method of the invention.
CC   The invention provides complete or partial genomic sequences of the MSRV-
CC   1 pol gene, gag gene and env gene, and polypeptides encoded by these
CC   genes. The invention also provides antibodies raised against the
CC   polypeptides. The genomic sequences, polypeptides and antibodies are also
CC   claimed useful for diagnosing infection by MS and rheumatoid arthritis-
CC   associated viruses, and also for prevention and treatment of infection
CC   with these viruses

CC   The invention relates to an isolated nucleic acid which comprises the pol
CC   gene of a retrovirus associated with multiple sclerosis or rheumatoid
CC   arthritis. The methods and compositions of the present invention are
CC   useful for diagnosing, preventing and/or treating multiple sclerosis
CC   and/or rheumatoid arthritis. The present sequence is used in the
CC   exemplification of the invention.

PT   Primer sets for synthesizing polynucleotides, particularly the 5602 full-
PT   length cDNAs defined in the specification, and for the detection and/or
PT   diagnosis of the abnormality of the proteins encoded by the full-length
PT   cDNAs.
XX
PS   Claim 1; SEQ ID NO 1650; 2537pp + Sequence Listing; English.
XX
CC   The present invention describes primer sets for synthesising 5602 full-
CC   length cDNAs defined in the specification. Where a primer set comprises:
CC   (a) an oligo-dT primer and an oligonucleotide complementary to the
CC   complementary strand of a polynucleotide which comprises one of the 5602
CC   nucleotide sequences defined in the specification, where the
CC   oligonucleotide comprises at least 15 nucleotides; or (b) a combination
CC   of an oligonucleotide comprising a sequence complementary to the
CC   complementary strand of a polynucleotide which comprises a 5'-end
CC   sequence and an oligonucleotide comprising a sequence complementary to a
CC   polynucleotide which comprises a 3'-end sequence, where the
CC   oligonucleotide comprises at least 15 nucleotides and the combination of
CC   the 5'-end sequence/3'-end sequence is selected from those defined in the
CC   specification. The primer sets can be used in antisense therapy and in
CC   gene therapy. The primers are useful for synthesising polynucleotides,
CC   particularly full-length cDNAs. The primers are also useful for the
CC   detection and/or diagnosis of the abnormality of the proteins encoded by
CC   the full-length cDNAs. The primers allow obtaining of the full-length
CC   cDNAs easily without any specialised methods. AAH03166 to AAH13628 and
CC   AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAB95893
CC   represent human amino acid sequences; and AAH13629 to AAH13632 represent
CC   oligonucleotides, all of which are used in the exemplification of the
CC   present invention

PT   New isolated or purified nucleic acid associated with multiple sclerosis
PT   and/or rheumatoid arthritis, useful for detecting a virus associated with
PT   multiple sclerosis or rheumatoid arthritis in a biological sample.
XX
PS   Disclosure; Page 82; 193pp; English.
XX
CC   The invention relates to an isolated or purified nucleic acid from a
CC   virus associated with multiple sclerosis and/or rheumatoid arthritis,
CC   multiple sclerosis-associated virus (MSRV)-1. The nucleic acids comprise
CC   pol, gag or reverse transcriptase genes (or their fragments) encoding the
CC   proteins or defined peptides (including immunodominant peptides,
CC   antigenic peptides or conserved motifs).Also included are a process for
CC   detecting a virus associated with multiple sclerosis or rheumatoid
CC   arthritis in a biological sample, a nucleic acid probe for the detection
CC   of a virus associated with multiple sclerosis or rheumatoid arthritis, a
CC   primer for the amplification by polymerisation of a nucleic acid of a
CC   viral material associated with multiple sclerosis or rheumatoid
CC   arthritis, a polypeptide exhibiting an inhibitory activity on the
CC   proteolytic, reverse transcriptase or ribonuclease H activity from MSRV,
```

```
CC   and an antibody directed against the MSRV-1 virus obtained by
CC   immunologically reacting a human or animal body or cells with an
CC   immunogenic agent consisting of the antigenic polypeptide defined above.
CC   The nucleic acids are useful for detecting a biological sample a virus
CC   associated with multiple sclerosis or rheumatoid arthritis, or for
CC   detecting in a biological sample, the presence of or exposure to a virus
CC   associated with multiple sclerosis or rheumatoid arthritis. The present
CC   sequence is an MSRV-associated sequence whose identity cannot be
CC   accurately determined. Note: The SEQ ID numbers for the sequences as
CC   displayed in the main body of the patent do not match the SEQ ID numbers
CC   in the sequence listing. Consequently those sequences mentioned in the
CC   claims may not be the sequences the authors intended to claim.

PT   LM7PC cell lines, or related nucleic acid.
XX
PS   Claim 3; Page 36-37; 68pp; French.
XX
CC   The invention relates to sequences isolated from members of a novel
CC   endogenous retrovirus family associated with sclerotic plaques and
CC   rheumatoid polyarthritis (RPA). The novel retroviral members are isolated
CC   from cells obtained from sclerotic plaques or synovial joint fluid from
CC   patients with RPA. Two novel strains of retrovirus are isolated: POL-2
CC   (ECACC V92072202) and MS7PG (ECACC V93010816), which are isolated from
CC   the cell lines PLI-2 and MS7PC respectively. This sequence is clone
CC   MSRV1nPR which corresponds to a fragment of the pol gene amplified in a
CC   nested PCR from retrovirus RNA isolated from synovial joint fluid cells
CC   of a patient with RPA. The sequences can be used for the diagnosis,
CC   prevention and treatment of RPA caused by infection or reactivation of
CC   the retroviruses. (Updated on 27-AUG-2003 to correct OS field.)

PT   LM7PC cell lines, or related nucleic acid.
XX
PS   Claim 3; Page 26-27; 68pp; French.
XX
CC   The invention relates to sequences isolated from members of a novel
CC   endogenous retrovirus family associated with sclerotic plaques and
CC   rheumatoid polyarthritis (RPA). The novel retroviral members are isolated
CC   from cells obtained from sclerotic plaques or synovial joint fluid from
CC   patients with RPA. Two novel strains of retrovirus are isolated: POL-2
CC   (ECACC V92072202) and MS7PG (ECACC V93010816), which are isolated from
CC   the cell lines PLI-2 and MS7PC respectively. This sequence is clone M003-
CC   P004 which lies between clones MSRV-1B (AAT37974-9) and clone PSJ17
CC   (AAT37981) and corresponds to a fragment of the pol gene from the
CC   viruses. The sequences can be used for the diagnosis, prevention and
CC   treatment of RPA caused by infection or reactivation of the retroviruses.
CC   (Updated on 27-AUG-2003 to correct OS field.)

CC   This is the sequence of a clone named M003-P004 which is derived from the
CC   multiple sclerosis related virus 1B (MSRV-1B), and lies between the 3'
CC   end of a clone designated "pol MSRV-1B" and the 5' end of the isolated
CC   clone PSJ17 (AAT96517). The sequence was PCR amplified by primers
CC   AAT96518-T96522. MSRV-1 sequences are associated with multiple sclerosis
CC   and some are also associated with rheumatoid arthritis. Nucleic acid
CC   sequences from the MSRV-1 virus can be used in the diagnosis of multiple
CC   sclerosis and rheumatoid arthritis

XX
CC The present sequence represents the multiple sclerosis (MS) associated
CC retrovirus-1 (MSRV-1) clone MOO3-POO4 DNA sequence. The invention
CC provides complete or partial genomic sequences of the MSRV-1 pol gene,
CC gag gene and env gene, and polypeptides encoded by these genes. The
CC invention also provides antibodies raised against the polypeptides. The
CC genomic sequences, polypeptides and antibodies are also claimed useful
CC for diagnosing infection by MS and rheumatoid arthritis-associated
CC viruses, and also for prevention and treatment of infection with these
CC viruses

PT New isolated or purified nucleic acid associated with multiple sclerosis
PT and/or rheumatoid arthritis, useful for detecting a virus associated with
PT multiple sclerosis or rheumatoid arthritis in a biological sample.
XX
PS Example 4; Fig 7; 193pp; English.
XX
CC The invention relates to an isolated or purified nucleic acid from a
CC virus associated with multiple sclerosis and/or rheumatoid arthritis,
CC multiple sclerosis-associated virus (MSRV)-1. The nucleic acids comprise
CC pol, gag or reverse transcriptase genes (or their fragments) encoding the
CC proteins or defined peptides (including immunodominant peptides,
CC antigenic peptides or conserved motifs).Also included are a process for
CC detecting a virus associated with multiple sclerosis or rheumatoid
CC arthritis in a biological sample, a nucleic acid probe for the detection
CC of a virus associated with multiple sclerosis or rheumatoid arthritis, a
CC primer for the amplification by polymerisation of a nucleic acid of a
CC viral material associated with multiple sclerosis or rheumatoid
CC arthritis, a polypeptide exhibiting an inhibitory activity on the
CC proteolytic, reverse transcriptase or ribonuclease H activity from MSRV,
CC and an antibody directed against the MSRV-1 virus obtained by
CC immunologically reacting a human or animal body or cells with an
CC immunogenic agent consisting of the antigenic polypeptide defined above.
CC The nucleic acids are useful for detecting a biological sample a virus
CC associated with multiple sclerosis or rheumatoid arthritis, or for
CC detecting in a biological sample, the presence of or exposure to a virus
CC associated with multiple sclerosis or rheumatoid arthritis. The present
CC sequence is an MSRV cDNA clone. Note: The SEQ ID numbers for the
CC sequences as displayed in the main body of the patent do not match the
CC SEQ ID numbers in the sequence listing. Consequently those sequences
CC mentioned in the claims may not be the sequences the authors intended to
CC claim.

PT New isolated nucleic acid and their fragments having the pol gene of a
PT retrovirus, useful for diagnosing, preventing and/or treating multiple
PT sclerosis and/or rheumatoid arthritis.
XX
PS Example 3; SEQ ID NO 8; 193pp; English.
XX
CC The invention relates to an isolated nucleic acid which comprises the pol
CC gene of a retrovirus associated with multiple sclerosis or rheumatoid
CC arthritis. The methods and compositions of the present invention are

```
CC   useful for diagnosing, preventing and/or treating multiple sclerosis
CC   and/or rheumatoid arthritis. The present sequence is used in the
CC   exemplification of the invention.

PT   Two pathogenic or infectious agents associated with multiple sclerosis -
PT   one being a retrovirus, useful for early diagnosis, prevention and
PT   treatment.
XX
PS   Claim 3; Page 59; 104pp; French.
XX
CC   The partial nucleotide sequence of the pol gene from the multiple
CC   sclerosis associated infectious agent clone designated MSRV-1B M003-P004.
CC   The MSRV-1B (AAT02815-23) and MSRV-2 clones (AAT02824-6) are derived from
CC   the same strain of infectious agent, either POL2 or MS7PG or their
CC   variants, and can be produced by the same cell line, LM7PC or PLI-2 or
CC   other cell culture infected with the multiple sclerosis associated
CC   agents. The clones were isolated by extracting nucleic acids from cells
CC   of multiple sclerosis patients, converting the nucleic acid to cDNA and
CC   PCR amplifying a region of the pol gene conserved in retroviruses. The
CC   clones isolated fell into 2 distinct types: one was similar to the ERV-9
CC   and HSERV-9 endogenous retroviruses and designated MSRV-1B; the others
CC   were highly homologous to the known agent MSRV-2 and designated MSRV-2B.
CC   The nucleic acid, probes or primers derived from these sequences can be
CC   used for detecting agents associated with multiple sclerosis. The probes
CC   may be used to discriminate between these agents, opt. in conjunction
CC   with amplification primers and antibodies specific for the infectious
CC   agents

PT New human genome-derived single exon nucleic acid probes useful for human
PT gene expression analysis, for identifying or characterizing alternative
PT splicing events, for assessing genomic alterations or as tools for
PT surveying tissues.
XX
PS Claim 1; SEQ ID NO 22647; 80pp; English.
XX
CC The invention relates to a nucleic acid probe for measuring human gene
CC expression, comprising any of the 27,400 fully defined nucleotide
CC sequences in the specification, or their complements or fragments, and
CC encoding at least 8 amino acids of any of the 6888 amino acid sequences
CC fully defined in the specification. The probe is a single exon probe that
CC hybridises under high stringency conditions to a nucleic acid molecule
CC expressed in human cells or tissues. Also included are a spatially-
CC addressable set of single exon nucleic acid probes for measuring human
CC gene expression (comprising a plurality of single exon nucleic acid
CC probes cited above, where each of the plurality of probes is separately
CC and addressably isolatable or amplifiable from the plurality), a single
CC exon microarray for measuring human gene expression, a method of
CC measuring human gene expression, a vector comprising the single exon
CC probe cited above, an ORF-encoded peptide comprising at least 8
CC contiguous amino acids of any of the above- mentioned amino acid
CC sequences (optionally with conservative amino acid substitutions), an
CC isolated antibody that binds specifically to a peptide cited above,
CC methods of selling and/or licensing single exon probes or microarrays to
CC a customer desiring to measure gene expression, a method of providing
CC human gene expression data by subscription, and a computer-readable
CC storage medium which contains a database having a plurality of records
CC (each record including data on the expression of a single exon probe
CC cited above. The probe, methods and apparatus are useful in gene
CC expression analysis. The probes may be used as tools for surveying
CC tissues to detect the presence of expressed messages that contain their
CC specific exon, or in constructing genome-derived single exon microarrays.
CC In addition, the probes are used in identifying and characterising
CC alternative splicing events, in detecting and characterising gross
CC alterations in the genomic locus that includes their exon, in assessing
CC smaller genomic alterations, in priming the synthesis of nucleic acids,
CC or in expressing the ORF-encoded peptide. The present sequence is a human
CC single exon probe of the invention. Note: The sequence data for this
CC patent did not form part of the printed specification, but was obtained
CC in electronic format directly from USPTO at
CC seqdata.uspto.gov/sequence.html?DocID=20030194704

PT   New nucleic acid from retroviruses - useful for diagnosis, prevention and
PT   treatment of, e.g. multiple sclerosis.
XX
PS   Disclosure; Page 183; 286pp; English.
XX
CC   The present sequence represents a multiple sclerosis (MS) associated
CC   retrovirus (MSRV) genomic fragment used in the method of the invention.
CC   The invention provides complete or partial genomic sequences of the MSRV-
CC   1 pol gene, gag gene and env gene, and polypeptides encoded by these
CC   genes. The invention also provides antibodies raised against the
CC   polypeptides. The genomic sequences, polypeptides and antibodies are also
CC   claimed useful for diagnosing infection by MS and rheumatoid arthritis-
CC   associated viruses, and also for prevention and treatment of infection
CC   with these viruses

PT  New isolated nucleic acid and their fragments having the pol gene of a
PT  retrovirus, useful for diagnosing, preventing and/or treating multiple
PT  sclerosis and/or rheumatoid arthritis.
XX
PS  Disclosure; SEQ ID NO 102; 193pp; English.
XX
CC  The invention relates to an isolated nucleic acid which comprises the pol
CC  gene of a retrovirus associated with multiple sclerosis or rheumatoid
CC  arthritis. The methods and compositions of the present invention are
CC  useful for diagnosing, preventing and/or treating multiple sclerosis
CC  and/or rheumatoid arthritis. The present sequence is used in the
CC  exemplification of the invention.

PT   New nucleic acid sequences from human endogenous retrovirus-W - expressed
PT   exclusively in placenta and useful in diagnosis and therapy of autoimmune
PT   disease, and abnormal or failed pregnancy.
XX
PS   Example 6; Page 92; 106pp; French.
XX
CC   This sequence represents a probe used to detect tissue distribution and
CC   copy number of the human endogenous retrovirus (HERV) W genome (AAX25665)
CC   in the human genome. Nucleic acids, their fragments or peptides encoded
CC   by them derived from the HERV-W genome are markers of autoimmune disease
CC   (e.g. multiple sclerosis, rheumatoid polyarthritis, disseminated lupus
CC   erythematosus, insulin-dependent diabetes and related pathologies) and of
CC   abnormal or unsuccessful pregnancy and can be used as chromosomal markers
CC   for susceptibility to these conditions, or proximity markers of genes
CC   associated with this susceptibility

PT   New nucleic acid from human endogenous retrovirus, useful e.g. for
PT   diagnosis of autoimmune disease and complications of pregnancy, contains
PT   at least part of the gag gene.
XX
PS   Disclosure; Page 42; 53pp; French.
XX
CC   The present sequence represents a probe which is used to detect and
CC   isolate an endogenous retroviral nucleic acid fragment, which is
CC   associated with an autoimmune disease, and is integrated into the human
CC   genome. The fragment is originally derived from a novel retrovirus, human
CC   endogenous retrovirus W (HERV-W). The fragment comprises (or consists of)
CC   at least part of the gag gene of the HERV-W retrovirus, which is
CC   associated with either autoimmune disease, failure of pregnancy or
CC   disorders of pregnancy. The nucleic acid fragment, or proteins derived
CC   from it, are useful for diagnosis of autoimmune disease (specifically
CC   multiple sclerosis) and for monitoring pregnancy. The nucleic acid
CC   fragments may also be used for in situ labelling of isolated chromosomes,
CC   while the transcription product can be used to study or monitor T cell
CC   proliferation in vitro

PT   New isolated or purified nucleic acid associated with multiple sclerosis
PT   and/or rheumatoid arthritis, useful for detecting a virus associated with
PT   multiple sclerosis or rheumatoid arthritis in a biological sample.
XX
PS   Claim 31; Page 76-77; 193pp; English.
XX
CC   The invention relates to an isolated or purified nucleic acid from a
CC   virus associated with multiple sclerosis and/or rheumatoid arthritis,
CC   multiple sclerosis-associated virus (MSRV)-1. The nucleic acids comprise
CC   pol, gag or reverse transcriptase genes (or their fragments) encoding the
CC   proteins or defined peptides (including immunodominant peptides,
CC   antigenic peptides or conserved motifs).Also included are a process for
CC   detecting a virus associated with multiple sclerosis or rheumatoid
CC   arthritis in a biological sample, a nucleic acid probe for the detection
CC   of a virus associated with multiple sclerosis or rheumatoid arthritis, a
CC   primer for the amplification by polymerisation of a nucleic acid of a
CC   viral material associated with multiple sclerosis or rheumatoid
CC   arthritis, a polypeptide exhibiting an inhibitory activity on the
CC   proteolytic, reverse transcriptase or ribonuclease H activity from MSRV,
CC   and an antibody directed against the MSRV-1 virus obtained by
CC   immunologically reacting a human or animal body or cells with an
CC   immunogenic agent consisting of the antigenic polypeptide defined above.
CC   The nucleic acids are useful for detecting a biological sample a virus
CC   associated with multiple sclerosis or rheumatoid arthritis, or for
```

```
CC   detecting in a biological sample, the presence of or exposure to a virus
CC   associated with multiple sclerosis or rheumatoid arthritis. The present
CC   sequence is a claimed MSRV-associated sequence whose identity cannot be
CC   accurately determined. Note: The SEQ ID numbers for the sequences as
CC   displayed in the main body of the patent do not match the SEQ ID numbers
CC   in the sequence listing. Consequently those sequences mentioned in the
CC   claims may not be the sequences the authors intended to claim.

CC   This sequence represents a probe used to detect tissue distribution and
CC   copy number of the human endogenous retrovirus (HERV) W genome (AAX25665)
CC   in the human genome. Nucleic acids, their fragments or peptides encoded
CC   by them derived from the HERV-W genome are markers of autoimmune disease
CC   (e.g. multiple sclerosis, rheumatoid polyarthritis, disseminated lupus
CC   erythematosus, insulin-dependent diabetes and related pathologies) and of
CC   abnormal or unsuccessful pregnancy and can be used as chromosomal markers
CC   for susceptibility to these conditions, or proximity markers of genes
CC   associated with this susceptibility

PT   New nucleic acid from human endogenous retrovirus, useful e.g. for
PT   diagnosis of autoimmune disease and complications of pregnancy, contains
PT   at least part of the gag gene.
XX
PS   Disclosure; Page 41-42; 53pp; French.
XX
CC   The present sequence represents a probe which is used to detect and
CC   isolate an endogenous retroviral nucleic acid fragment, which is
CC   associated with an autoimmune disease, and is integrated into the human
CC   genome. The fragment is originally derived from a novel retrovirus, human
CC   endogenous retrovirus W (HERV-W). The fragment comprises (or consists of)
CC   at least part of the gag gene of the HERV-W retrovirus, which is
CC   associated with either autoimmune disease, failure of pregnancy or
CC   disorders of pregnancy. The nucleic acid fragment, or proteins derived
CC   from it, are useful for diagnosis of autoimmune disease (specifically
CC   multiple sclerosis) and for monitoring pregnancy. The nucleic acid
CC   fragments may also be used for in situ labelling of isolated chromosomes,
CC   while the transcription product can be used to study or monitor T cell
CC   proliferation in vitro

PT   New isolated polynucleotide and encoded polypeptides, useful in
PT   diagnostics, forensics, gene mapping, identification of mutations
PT   responsible for genetic disorders or other traits and to assess
PT   biodiversity.
XX
PS   Claim 1; SEQ ID NO 24195; 103pp; English.
XX
CC   The invention relates to isolated polynucleotide (I) and polypeptide (II)
CC   sequences. (I) is useful as hybridisation probes, polymerase chain
CC   reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
CC   and in recombinant production of (II). The polynucleotides are also used
CC   in diagnostics as expressed sequence tags for identifying expressed
CC   genes. (I) is useful in gene therapy techniques to restore normal
CC   activity of (II) or to treat disease states involving (II). (II) is
CC   useful for generating antibodies against it, detecting or quantitating a
CC   polypeptide in tissue, as molecular weight markers and as a food
CC   supplement. (II) and its binding partners are useful in medical imaging
CC   of sites expressing (II). (I) and (II) are useful for treating disorders
CC   involving aberrant protein expression or biological activity. The
CC   polypeptide and polynucleotide sequences have applications in
CC   diagnostics, forensics, gene mapping, identification of mutations
CC   responsible for genetic disorders or other traits to assess biodiversity
CC   and to produce other types of data and products dependent on DNA and
CC   amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
CC   coding sequences of the invention. Note: The sequence data for this
CC   patent did not appear in the printed specification, but was obtained in
CC   electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PT   Single exon nucleic acid probes for analyzing gene expression in human
PT   hearts.
XX
PS   Claim 1; SEQ ID NO 7607; 530pp; English.
XX
CC   The present invention relates to single exon nucleic acid probes for
CC   measuring human gene expression in a sample derived from human heart. The
CC   present sequence is one such probe. The probes may be used for
CC   predicting, measuring and displaying gene expression in samples derived
CC   from the human heart via microarrays. By measuring gene expression, the
CC   probes are useful for predicting, diagnosing, grading, staging,
CC   monitoring and prognosing diseases of the human heart and vascular system
CC   e.g. cardiovascular disease, hypertension, cardiac arrhythmias and
CC   congenital heart disease. Note: The sequence data for this patent did not
CC   form part of the printed specification, but was obtained in electronic
CC   format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

PT   Human genome-derived single exon nucleic acid probes useful for analyzing
PT   gene expression in human adult liver.
XX
PS   Claim 1; SEQ ID NO 10245; 658pp; English.
XX
CC   The invention relates to a single exon nucleic acid probe (SENP) (I) for
CC   measuring human gene expression in a sample derived from human adult
CC   liver, comprising one of 13109 defined nucleotide sequences given in the
CC   specification (or complements/ fragments). The probe hybridises at high
CC   stringency to a nucleic acid molecule expressed in the human adult liver.
CC   (I) may be used for predicting, measuring and displaying gene expression
CC   in samples derived from human adult liver. The genes identified may be
CC   involved in genetic liver diseases such as cirrhosis,
CC   hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is
CC   associated with coronary heart disease. ABS25011-ABS51005 represent human
CC   liver single exon nucleic acid probes of the invention. Note: The
CC   sequence information for this patent does not appear in the printed
CC   specification but was obtained in electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PT   Spatially-addressable set of single exon nucleic acid probes, used to
PT   measure gene expression in human lung samples.
XX
PS   Claim 1; SEQ ID NO 9851; 634pp; English.
XX
CC   The invention relates to a spatially-addressable set of single exon
CC   nucleic acid probes for measuring gene expression in a sample derived
CC   from human lung comprising single exon nucleic acid probes having one of
CC   12614 nucleic acid sequences mentioned in the specification, or their
CC   complements or the 12387 open reading frames derived from the 12614
CC   probes. Also included are a microarray comprising the novel set of probes
CC   ; the novel set of probes which hybridise at high stringency to a nucleic
CC   acid expressed in the human lung; measuring gene expression in a sample
CC   derived from human lung, comprising (a) contacting the array with a
CC   collection of detectably labeled nucleic acids derived from human lung
CC   mRNA, and (b) measuring the label detectably bound to each probe of the
CC   array; identifying exons in a eukaryotic genome, comprising (a)
CC   algorithmically predicting at least one exon from genomic sequences of
CC   the eukaryote; and (b) detecting specific hybridisation of detectably
CC   labeled nucleic acids from eukaryote lung mRNA, to a single exon probe,
CC   having a fragment identical to the predicted exon, the probe is included
CC   in the above mentioned microarray; assigning exons to a single gene,
CC   comprising (a) identifying exons from genomic sequence by the method
CC   above and (b) measuring the expression of each of the exons in several
CC   tissues and/or cell types using hybridisation to a single exon
CC   microarrays having a probe with the exon, where a common pattern of
CC   expression of the exons in the tissues and/or cell types indicates that
```

```
CC   the exons should be assigned to a single gene; a peptide comprising one
CC   of 12011 sequences, mentioned in the specification, or encoded by the
CC   probes/open reading frames (ORF). The probes are used for gene expression
CC   analysis, and for identifying exons in a gene, particularly using human
CC   lung derived mRNA and for the study of lung diseases such as asthma, lung
CC   cancer, chronic obstructive pulmonary disease (COPD), interstitial lung
CC   disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis,
CC   tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-
CC   Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary
CC   histiocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis,
CC   Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary
CC   dyskinesis, pulmonary hypertension and hyaline membrane disease. The
CC   present sequence is a single exon probe of the invention. Note: The
CC   sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/published_pct_sequences

PT   New human genome-derived single exon nucleic acid probes useful for human
PT   gene expression analysis, for identifying or characterizing alternative
PT   splicing events, for assessing genomic alterations or as tools for
PT   surveying tissues.
XX
PS   Claim 15; SEQ ID NO 8924; 80pp; English.
XX
CC   The invention relates to a nucleic acid probe for measuring human gene
CC   expression, comprising any of the 27,400 fully defined nucleotide
CC   sequences in the specification, or their complements or fragments, and
CC   encoding at least 8 amino acids of any of the 6888 amino acid sequences
CC   fully defined in the specification. The probe is a single exon probe that
CC   hybridises under high stringency conditions to a nucleic acid molecule
CC   expressed in human cells or tissues. Also included are a spatially-
CC   addressable set of single exon nucleic acid probes for measuring human
CC   gene expression (comprising a plurality of single exon nucleic acid
CC   probes cited above, where each of the plurality of probes is separately
CC   and addressably isolatable or amplifiable from the plurality), a single
CC   exon microarray for measuring human gene expression, a method of
CC   measuring human gene expression, a vector comprising the single exon
CC   probe cited above, an ORF-encoded peptide comprising at least 8
CC   contiguous amino acids of any of the above- mentioned amino acid
CC   sequences (optionally with conservative amino acid substitutions), an
CC   isolated antibody that binds specifically to a peptide cited above,
CC   methods of selling and/or licensing single exon probes or microarrays to
CC   a customer desiring to measure gene expression, a method of providing
CC   human gene expression data by subscription, and a computer-readable
CC   storage medium which contains a database having a plurality of records
CC   (each record including data on the expression of a single exon probe
CC   cited above. The probe, methods and apparatus are useful in gene
CC   expression analysis. The probes may be used as tools for surveying
CC   tissues to detect the presence of expressed messages that contain their
CC   specific exon, or in constructing genome-derived single exon microarrays.
CC   In addition, the probes are used in identifying and characterising
CC   alternative splicing events, in detecting and characterising gross
CC   alterations in the genomic locus that includes their exon, in assessing
CC   smaller genomic alterations, in priming the synthesis of nucleic acids,
CC   or in expressing the ORF-encoded peptide. The present sequence is a human
CC   single exon probe of the invention. Note: The sequence data for this
CC   patent did not form part of the printed specification, but was obtained
CC   in electronic format directly from USPTO at
CC   seqdata.uspto.gov/sequence.html?DocID=20030194704

```

```
CC   The invention relates to a single exon nucleic acid probe for measuring
CC   human gene expression in a sample derived from human foetal liver. The
CC   single exon nucleic acid probes may be used for predicting, measuring and
CC   displaying gene expression in samples derived from human fetal liver. The
CC   present sequence is a single exon nucleic acid probe of the invention.
CC   Note: The sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/published_pct_sequences

CC   The present invention provides a number of single exon nucleic acid
CC   probes which are derived from genomic sequences expressed in the human
CC   bone marrow. They can be used to measure gene expression in bone marrow
CC   samples, which may enable the improved diagnosis and treatment of cancers
CC   such as lymphoma, leukaemia and myeloma. The present sequence is one of
CC   the probes of the invention

PT   Single exon nucleic acid probes for analyzing gene expression in human
PT   brains.
XX
PS   Example 4; SEQ ID NO 10364; 650pp + Sequence Listing; English.
XX
CC   The present invention provides a number of single exon nucleic acid
CC   probes which are derived from genomic sequences expressed in the human
CC   brain. They can be used to measure gene expression in brain cell samples,
CC   which may enable the diagnosis and improved treatment of nervous system
CC   diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia,
CC   epilepsy and cancers. The present sequence is one of the probes of the
CC   invention

PT   Human genome-derived single exon nucleic acid probes useful for analyzing
PT   gene expression in human adult liver.
XX
PS   Claim 1; SEQ ID NO 10945; 658pp; English.
XX
CC   The invention relates to a single exon nucleic acid probe (SENP) (I) for
CC   measuring human gene expression in a sample derived from human adult
CC   liver, comprising one of 13109 defined nucleotide sequences given in the
CC   specification (or complements/ fragments). The probe hybridises at high
CC   stringency to a nucleic acid molecule expressed in the human adult liver.
CC   (I) may be used for predicting, measuring and displaying gene expression
CC   in samples derived from human adult liver. The genes identified may be
CC   involved in genetic liver diseases such as cirrhosis,
CC   hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is
CC   associated with coronary heart disease. ABS25011-ABS51005 represent human
CC   liver single exon nucleic acid probes of the invention. Note: The
CC   sequence information for this patent does not appear in the printed
CC   specification but was obtained in electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PT   Spatially-addressable set of single exon nucleic acid probes, used to
PT   measure gene expression in human lung samples.
XX
PS   Claim 1; SEQ ID NO 10353; 634pp; English.
XX
CC   The invention relates to a spatially-addressable set of single exon
CC   nucleic acid probes for measuring gene expression in a sample derived
CC   from human lung comprising single exon nucleic acid probes having one of
CC   12614 nucleic acid sequences mentioned in the specification, or their
CC   complements or the 12387 open reading frames derived from the 12614
CC   probes. Also included are a microarray comprising the novel set of probes
CC   ; the novel set of probes which hybridise at high stringency to a nucleic
CC   acid expressed in the human lung; measuring gene expression in a sample
CC   derived from human lung, comprising (a) contacting the array with a
CC   collection of detectably labeled nucleic acids derived from human lung
CC   mRNA, and (b) measuring the label detectably bound to each probe of the
CC   array; identifying exons in a eukaryotic genome, comprising (a)
CC   algorithmically predicting at least one exon from genomic sequences of
CC   the eukaryote; and (b) detecting specific hybridisation of detectably
CC   labeled nucleic acids from eukaryote lung mRNA, to a single exon probe,
CC   having a fragment identical to the predicted exon, the probe is included
CC   in the above mentioned microarray; assigning exons to a single gene,
CC   comprising (a) identifying exons from genomic sequence by the method
CC   above and (b) measuring the expression of each of the exons in several
CC   tissues and/or cell types using hybridisation to a single exon
CC   microarrays having a probe with the exon, where a common pattern of
CC   expression of the exons in the tissues and/or cell types indicates that
CC   the exons should be assigned to a single gene; a peptide comprising one
CC   of 12011 sequences, mentioned in the specification, or encoded by the
CC   probes/open reading frames (ORF). The probes are used for gene expression
CC   analysis, and for identifying exons in a gene, particularly using human
CC   lung derived mRNA and for the study of lung diseases such as asthma, lung
CC   cancer, chronic obstructive pulmonary disease (COPD), interstitial lung
CC   disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis,
CC   tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-
CC   Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary
CC   histiocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis,
CC   Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary
CC   dyskinesis, pulmonary hypertension and hyaline membrane disease. The
CC   present sequence is a single exon probe of the invention. Note: The
CC   sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/published_pct_sequences

PT   New human genome-derived single exon nucleic acid probes useful for human
PT   gene expression analysis, for identifying or characterizing alternative
PT   splicing events, for assessing genomic alterations or as tools for
PT   surveying tissues.
XX
PS   Claim 15; SEQ ID NO 10274; 80pp; English.
XX
CC   The invention relates to a nucleic acid probe for measuring human gene
CC   expression, comprising any of the 27,400 fully defined nucleotide
CC   sequences in the specification, or their complements or fragments, and
CC   encoding at least 8 amino acids of any of the 6888 amino acid sequences
CC   fully defined in the specification. The probe is a single exon probe that
CC   hybridises under high stringency conditions to a nucleic acid molecule
CC   expressed in human cells or tissues. Also included are a spatially-
CC   addressable set of single exon nucleic acid probes for measuring human
CC   gene expression (comprising a plurality of single exon nucleic acid
CC   probes cited above, where each of the plurality of probes is separately
CC   and addressably isolatable or amplifiable from the plurality), a single
CC   exon microarray for measuring human gene expression, a method of
CC   measuring human gene expression, a vector comprising the single exon
CC   probe cited above, an ORF-encoded peptide comprising at least 8
CC   contiguous amino acids of any of the above- mentioned amino acid
CC   sequences (optionally with conservative amino acid substitutions), an
CC   isolated antibody that binds specifically to a peptide cited above,
CC   methods of selling and/or licensing single exon probes or microarrays to
CC   a customer desiring to measure gene expression, a method of providing
CC   human gene expression data by subscription, and a computer-readable
CC   storage medium which contains a database having a plurality of records
CC   (each record including data on the expression of a single exon probe
CC   cited above. The probe, methods and apparatus are useful in gene
CC   expression analysis. The probes may be used as tools for surveying
CC   tissues to detect the presence of expressed messages that contain their
CC   specific exon, or in constructing genome-derived single exon microarrays.
CC   In addition, the probes are used in identifying and characterising
CC   alternative splicing events, in detecting and characterising gross
CC   alterations in the genomic locus that includes their exon, in assessing
CC   smaller genomic alterations, in priming the synthesis of nucleic acids,
CC   or in expressing the ORF-encoded peptide. The present sequence is a human
CC   single exon probe of the invention. Note: The sequence data for this
CC   patent did not form part of the printed specification, but was obtained
CC   in electronic format directly from USPTO at

XX
PT   Human genome-derived single exon nucleic acid probes useful for analyzing
PT   gene expression in human cervical epithelial cells.
XX
PS   Claim 25; SEQ ID NO 6933; 487pp; English.
XX
CC   The present invention relates to human single exon nucleic acid probes
CC   (SENP). The present sequence is one such probe. The SENPs are derived
CC   from human HeLa cells. The SENPs can be used to produce a single exon
CC   microarray, which can be used for measuring human gene expression in a
CC   sample derived from human cervical epithelial cells. By measuring gene
CC   expression, the probes are therefore useful in grading and/or staging of
CC   diseases of the cervix, notably cervical cancer. Note: The sequence data
CC   for this patent did not form part of the printed specification, but was
CC   obtained in electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

CC   The present invention relates to single exon nucleic acid probes for
CC   measuring human gene expression in a sample derived from human heart. The
CC   present sequence is one such probe. The probes may be used for
CC   predicting, measuring and displaying gene expression in samples derived
CC   from the human heart via microarrays. By measuring gene expression, the
CC   probes are useful for predicting, diagnosing, grading, staging,
CC   monitoring and prognosing diseases of the human heart and vascular system
CC   e.g. cardiovascular disease, hypertension, cardiac arrhythmias and
CC   congenital heart disease. Note: The sequence data for this patent did not
CC   form part of the printed specification, but was obtained in electronic
CC   format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

PT   Human genome-derived single exon nucleic acid probes useful for analyzing
PT   gene expression in human adult liver.
XX
PS   Claim 1; SEQ ID NO 10071; 658pp; English.
XX
CC   The invention relates to a single exon nucleic acid probe (SENP) (I) for
```

```
CC   measuring human gene expression in a sample derived from human adult
CC   liver, comprising one of 13109 defined nucleotide sequences given in the
CC   specification (or complements/ fragments). The probe hybridises at high
CC   stringency to a nucleic acid molecule expressed in the human adult liver.
CC   (I) may be used for predicting, measuring and displaying gene expression
CC   in samples derived from human adult liver. The genes identified may be
CC   involved in genetic liver diseases such as cirrhosis,
CC   hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is
CC   associated with coronary heart disease. ABS25011-ABS51005 represent human
CC   liver single exon nucleic acid probes of the invention. Note: The
CC   sequence information for this patent does not appear in the printed
CC   specification but was obtained in electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PT   Spatially-addressable set of single exon nucleic acid probes, used to
PT   measure gene expression in human lung samples.
XX
PS   Claim 1; SEQ ID NO 9725; 634pp; English.
XX
CC   The invention relates to a spatially-addressable set of single exon
CC   nucleic acid probes for measuring gene expression in a sample derived
CC   from human lung comprising single exon nucleic acid probes having one of
CC   12614 nucleic acid sequences mentioned in the specification, or their
CC   complements or the 12387 open reading frames derived from the 12614
CC   probes. Also included are a microarray comprising the novel set of probes
CC   ; the novel set of probes which hybridise at high stringency to a nucleic
CC   acid expressed in the human lung; measuring gene expression in a sample
CC   derived from human lung, comprising (a) contacting the array with a
CC   collection of detectably labeled nucleic acids derived from human lung
CC   mRNA, and (b) measuring the label detectably bound to each probe of the
CC   array; identifying exons in a eukaryotic genome, comprising (a)
CC   algorithmically predicting at least one exon from genomic sequences of
CC   the eukaryote; and (b) detecting specific hybridisation of detectably
CC   labeled nucleic acids from eukaryote lung mRNA, to a single exon probe,
CC   having a fragment identical to the predicted exon, the probe is included
CC   in the above mentioned microarray; assigning exons to a single gene,
CC   comprising (a) identifying exons from genomic sequence by the method
CC   above and (b) measuring the expression of each of the exons in several
CC   tissues and/or cell types using hybridisation to a single exon
CC   microarrays having a probe with the exon, where a common pattern of
CC   expression of the exons in the tissues and/or cell types indicates that
CC   the exons should be assigned to a single gene; a peptide comprising one
CC   of 12011 sequences, mentioned in the specification, or encoded by the
CC   probes/open reading frames (ORF). The probes are used for gene expression
CC   analysis, and for identifying exons in a gene, particularly using human
CC   lung derived mRNA and for the study of lung diseases such as asthma, lung
CC   cancer, chronic obstructive pulmonary disease (COPD), interstitial lung
CC   disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis,
CC   tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-
CC   Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary
CC   histiocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis,
CC   Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary
CC   dyskinesis, pulmonary hypertension and hyaline membrane disease. The
CC   present sequence is a single exon probe of the invention. Note: The
CC   sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/published_pct_sequences

PT   New nucleic acid that is a 5' expressed sequence tag (5' EST) for
PT   obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for
PT   diagnostic, forensic, gene therapy and chromosome mapping procedures.
XX
PS   Claim 1; SEQ ID NO 21394; 71pp + Sequence Listing; English.
XX
CC   The present sequence is one of a large number of 5' ESTs derived from
CC   mRNAs encoding secreted proteins. No ORF has yet been conclusively
CC   identified within the present sequence. The 5' ESTs were prepared from
CC   total human RNAs or polyA+ RNAs derived from 30 different tissues. EST
CC   sequences usually correspond mainly to the 3' untranslated region (UTR)
CC   of the mRNA because they are often obtained from oligo-dT primed cDNA
CC   libraries. Such ESTs are not well suited for isolating cDNA sequences
CC   derived from the 5' ends of mRNAs and even in those cases where longer
CC   cDNA sequences have been obtained, the full 5' UTR is rarely included. 5'
CC   ESTs are derived from mRNAs with intact 5' ends and can therefore be used
CC   to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in
CC   diagnostic, forensic, gene therapy and chromosome mapping procedures.
CC   They are used to obtain upstream regulatory sequences and to design
CC   expression and secretion vectors

XX
PS   Claim 1; SEQ ID NO 20359; 80pp; English.
XX
CC   The invention relates to a nucleic acid probe for measuring human gene
CC   expression, comprising any of the 27,400 fully defined nucleotide
CC   sequences in the specification, or their complements or fragments, and
CC   encoding at least 8 amino acids of any of the 6888 amino acid sequences
CC   fully defined in the specification. The probe is a single exon probe that
CC   hybridises under high stringency conditions to a nucleic acid molecule
CC   expressed in human cells or tissues. Also included are a spatially-
CC   addressable set of single exon nucleic acid probes for measuring human
CC   gene expression (comprising a plurality of single exon nucleic acid
CC   probes cited above, where each of the plurality of probes is separately
CC   and addressably isolatable or amplifiable from the plurality), a single
CC   exon microarray for measuring human gene expression, a method of
CC   measuring human gene expression, a vector comprising the single exon
CC   probe cited above, an ORF-encoded peptide comprising at least 8
CC   contiguous amino acids of any of the above- mentioned amino acid
CC   sequences (optionally with conservative amino acid substitutions), an
CC   isolated antibody that binds specifically to a peptide cited above,
CC   methods of selling and/or licensing single exon probes or microarrays to
CC   a customer desiring to measure gene expression, a method of providing
CC   human gene expression data by subscription, and a computer-readable
CC   storage medium which contains a database having a plurality of records
CC   (each record including data on the expression of a single exon probe
CC   cited above. The probe, methods and apparatus are useful in gene
CC   expression analysis. The probes may be used as tools for surveying
CC   tissues to detect the presence of expressed messages that contain their
CC   specific exon, or in constructing genome-derived single exon microarrays.
CC   In addition, the probes are used in identifying and characterising
CC   alternative splicing events, in detecting and characterising gross
```

```
CC   alterations in the genomic locus that includes their exon, in assessing
CC   smaller genomic alterations, in priming the synthesis of nucleic acids,
CC   or in expressing the ORF-encoded peptide. The present sequence is a human
CC   single exon probe of the invention. Note: The sequence data for this
CC   patent did not form part of the printed specification, but was obtained
CC   in electronic format directly from USPTO at
CC   seqdata.uspto.gov/sequence.html?DocID=20030194704

PT   New human genome-derived single exon nucleic acid probes useful for human
PT   gene expression analysis, for identifying or characterizing alternative
PT   splicing events, for assessing genomic alterations or as tools for
PT   surveying tissues.
XX
PS   Claim 15; SEQ ID NO 6530; 80pp; English.
XX
CC   The invention relates to a nucleic acid probe for measuring human gene
CC   expression, comprising any of the 27,400 fully defined nucleotide
CC   sequences in the specification, or their complements or fragments, and
CC   encoding at least 8 amino acids of any of the 6888 amino acid sequences
CC   fully defined in the specification. The probe is a single exon probe that
CC   hybridises under high stringency conditions to a nucleic acid molecule
CC   expressed in human cells or tissues. Also included are a spatially-
CC   addressable set of single exon nucleic acid probes for measuring human
CC   gene expression (comprising a plurality of single exon nucleic acid
CC   probes cited above, where each of the plurality of probes is separately
CC   and addressably isolatable or amplifiable from the plurality), a single
CC   exon microarray for measuring human gene expression, a method of
CC   measuring human gene expression, a vector comprising the single exon
CC   probe cited above, an ORF-encoded peptide comprising at least 8
CC   contiguous amino acids of any of the above- mentioned amino acid
CC   sequences (optionally with conservative amino acid substitutions), an
CC   isolated antibody that binds specifically to a peptide cited above,
CC   methods of selling and/or licensing single exon probes or microarrays to
CC   a customer desiring to measure gene expression, a method of providing
CC   human gene expression data by subscription, and a computer-readable
CC   storage medium which contains a database having a plurality of records
CC   (each record including data on the expression of a single exon probe
CC   cited above. The probe, methods and apparatus are useful in gene
CC   expression analysis. The probes may be used as tools for surveying
CC   tissues to detect the presence of expressed messages that contain their
CC   specific exon, or in constructing genome-derived single exon microarrays.
CC   In addition, the probes are used in identifying and characterising
CC   alternative splicing events, in detecting and characterising gross
CC   alterations in the genomic locus that includes their exon, in assessing
CC   smaller genomic alterations, in priming the synthesis of nucleic acids,
CC   or in expressing the ORF-encoded peptide. The present sequence is a human
CC   single exon probe of the invention. Note: The sequence data for this
CC   patent did not form part of the printed specification, but was obtained
CC   in electronic format directly from USPTO at
CC   seqdata.uspto.gov/sequence.html?DocID=20030194704

XX
CC   The present invention relates to human single exon nucleic acid probes
CC   (SENP). The present sequence is one such probe. The SENPs are derived
CC   from human HeLa cells. The SENPs can be used to produce a single exon
CC   microarray, which can be used for measuring human gene expression in a
CC   sample derived from human cervical epithelial cells. By measuring gene
CC   expression, the probes are therefore useful in grading and/or staging of
CC   diseases of the cervix, notably cervical cancer. Note: The sequence data
CC   for this patent did not form part of the printed specification, but was
CC   obtained in electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PT Human genome-derived single exon nucleic acid probes useful for analyzing
PT gene expression in human fetal liver.
XX
PS Claim 1; SEQ ID NO 1859; 639pp + Sequence Listing; English.
XX
CC The invention relates to a single exon nucleic acid probe for measuring
CC human gene expression in a sample derived from human foetal liver. The
CC single exon nucleic acid probes may be used for predicting, measuring and
CC displaying gene expression in samples derived from human fetal liver. The
CC present sequence is a single exon nucleic acid probe of the invention.
CC Note: The sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from WIPO

PT   New spatially-addressable set of single exon nucleic acid probes, useful
PT   for measuring gene expression in sample derived from human breast,
PT   comprises number of single exon nucleic acid probes.
XX
PS   Claim 1; SEQ ID NO 1832; 327pp + Sequence Listing; English.
XX
CC   The invention relates to a spatially-addressable set of single exon
CC   nucleic acid probes for measuring gene expression in a sample derived
CC   from human breast and BT 474 cells. The method involves contacting the
CC   probes with a collection of detectably labelled nucleic acids derived
CC   from mRNA of human breast, and then measuring the label bound to each
CC   probe of the microarray. The probes are useful for verifying the
CC   expression of regions of genomic DNA predicted to encode proteins. They
CC   are useful for gene discovery, and for determining predisposition and/or
CC   prognosing breast disease. Gene expression analysis is useful for
CC   assessing the toxicity of chemical agents on cells. The microarray of
CC   this invention presents a far greater diversity of probes for measuring
CC   gene expression, with far less bias than expressed sequence tag
CC   microarrays. The method is suitable for rapid production of functional
CC   information from genomic sequence. The present sequence is a single exon
CC   nucleic acid probe of the invention. Note: The sequence data for this
CC   patent did not form part of the printed specification, but was obtained
CC   in electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

CC   The present invention provides a number of single exon nucleic acid
CC   probes which are derived from genomic sequences expressed in the human
CC   brain. They can be used to measure gene expression in brain cell samples,
CC   which may enable the diagnosis and improved treatment of nervous system
CC   diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia,
CC   epilepsy and cancers. The present sequence is one of the probes of the
CC   invention

PT Human genome-derived single exon nucleic acid probes useful for analyzing
PT gene expression in human adult liver.
XX
PS Claim 1; SEQ ID NO 1844; 658pp; English.
XX
CC The invention relates to a single exon nucleic acid probe (SENP) (I) for
CC measuring human gene expression in a sample derived from human adult
CC liver, comprising one of 13109 defined nucleotide sequences given in the
CC specification (or complements/ fragments). The probe hybridises at high
CC stringency to a nucleic acid molecule expressed in the human adult liver.
CC (I) may be used for predicting, measuring and displaying gene expression
CC in samples derived from human adult liver. The genes identified may be
CC involved in genetic liver diseases such as cirrhosis,
CC hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is
CC associated with coronary heart disease. ABS25011-ABS51005 represent human
CC liver single exon nucleic acid probes of the invention. Note: The
CC sequence information for this patent does not appear in the printed
CC specification but was obtained in electronic format directly from WIPO at
CC ftp.wipo.int/pub/published_pct_sequences

PT   Novel single exon nucleic acid probe used to measuring gene expression in
PT   a human breast.
XX
PS   Claim 25; SEQ ID NO 1785; 322pp; English.
XX
CC   The present invention relates to novel single exon nucleic acid probes.
CC   The present sequence is one such probe. The probes are useful for
CC   measuring human gene expression in a human breast sample, where the probe
CC   hybridises at high stringency to a nucleic acid expressed in the human
CC   breast. The probes are useful for predicting, diagnosing, grading,
CC   staging, monitoring and prognosing diseases of the human breast,
CC   particularly those diseases with polygenic aetiology. The diseases
CC   include: breast cancer, disorders of development, inflammatory diseases
CC   of the breast, fibrocystic changes, proliferative breast disease and non-
CC   carcinoma tumours. Note: The sequence data for this patent did not form
CC   part of the printed specification, but was obtained in electronic format
CC   directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

PT   Spatially-addressable set of single exon nucleic acid probes, used to
PT   measure gene expression in human lung samples.
XX
PS   Claim 1; SEQ ID NO 1797; 634pp; English.
XX
CC   The invention relates to a spatially-addressable set of single exon
CC   nucleic acid probes for measuring gene expression in a sample derived
CC   from human lung comprising single exon nucleic acid probes having one of
CC   12614 nucleic acid sequences mentioned in the specification, or their
CC   complements or the 12387 open reading frames derived from the 12614
CC   probes. Also included are a microarray comprising the novel set of probes
CC   ; the novel set of probes which hybridise at high stringency to a nucleic
CC   acid expressed in the human lung; measuring gene expression in a sample
CC   derived from human lung, comprising (a) contacting the array with a
CC   collection of detectably labeled nucleic acids derived from human lung
CC   mRNA, and (b) measuring the label detectably bound to each probe of the
CC   array; identifying exons in a eukaryotic genome, comprising (a)
CC   algorithmically predicting at least one exon from genomic sequences of
CC   the eukaryote; and (b) detecting specific hybridisation of detectably
CC   labeled nucleic acids from eukaryote lung mRNA, to a single exon probe,
CC   having a fragment identical to the predicted exon, the probe is included
CC   in the above mentioned microarray; assigning exons to a single gene,
CC   comprising (a) identifying exons from genomic sequence by the method
CC   above and (b) measuring the expression of each of the exons in several
CC   tissues and/or cell types using hybridisation to a single exon
CC   microarrays having a probe with the exon, where a common pattern of
CC   expression of the exons in the tissues and/or cell types indicates that
CC   the exons should be assigned to a single gene; a peptide comprising one
CC   of 12011 sequences, mentioned in the specification, or encoded by the
CC   probes/open reading frames (ORF). The probes are used for gene expression
CC   analysis, and for identifying exons in a gene, particularly using human
CC   lung derived mRNA and for the study of lung diseases such as asthma, lung
CC   cancer, chronic obstructive pulmonary disease (COPD), interstitial lung
CC   disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis,
CC   tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-
CC   Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary
CC   histiocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis,
CC   Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary
CC   dyskinesis, pulmonary hypertension and hyaline membrane disease. The
CC   present sequence is a single exon probe of the invention. Note: The
```

```
CC   sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO

XX
CC   The invention relates to a single exon nucleic acid probe for measuring
CC   human gene expression in a sample derived from human foetal liver. The
CC   single exon nucleic acid probes may be used for predicting, measuring and
CC   displaying gene expression in samples derived from human fetal liver. The
CC   present sequence is a single exon nucleic acid probe of the invention.
CC   Note: The sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO

XX
CC   The present invention provides a number of single exon nucleic acid
CC   probes which are derived from genomic sequences expressed in the human
CC   brain. They can be used to measure gene expression in brain cell samples,
CC   which may enable the diagnosis and improved treatment of nervous system
CC   diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia,
CC   epilepsy and cancers. The present sequence is one of the probes of the
CC   invention

PT   Human genome-derived single exon nucleic acid probes useful for analyzing
PT   gene expression in human adult liver.
XX
PS   Claim 1; SEQ ID NO 9211; 658pp; English.
XX
CC   The invention relates to a single exon nucleic acid probe (SENP) (I) for
CC   measuring human gene expression in a sample derived from human adult
CC   liver, comprising one of 13109 defined nucleotide sequences given in the
CC   specification (or complements/ fragments). The probe hybridises at high
CC   stringency to a nucleic acid molecule expressed in the human adult liver.
CC   (I) may be used for predicting, measuring and displaying gene expression
CC   in samples derived from human adult liver. The genes identified may be
CC   involved in genetic liver diseases such as cirrhosis,
CC   hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is
CC   associated with coronary heart disease. ABS25011-ABS51005 represent human
CC   liver single exon nucleic acid probes of the invention. Note: The
CC   sequence information for this patent does not appear in the printed
CC   specification but was obtained in electronic format directly from WIPO at
CC   ftp.wipo.int/pub/published_pct_sequences

PT Spatially-addressable set of single exon nucleic acid probes, used to
PT measure gene expression in human lung samples.
XX
PS Claim 1; SEQ ID NO 9105; 634pp; English.
XX
CC The invention relates to a spatially-addressable set of single exon
CC nucleic acid probes for measuring gene expression in a sample derived
CC from human lung comprising single exon nucleic acid probes having one of
CC 12614 nucleic acid sequences mentioned in the specification, or their
CC complements or the 12387 open reading frames derived from the 12614
CC probes. Also included are a microarray comprising the novel set of probes
CC ; the novel set of probes which hybridise at high stringency to a nucleic
CC acid expressed in the human lung; measuring gene expression in a sample
CC derived from human lung, comprising (a) contacting the array with a
CC collection of detectably labeled nucleic acids derived from human lung
CC mRNA, and (b) measuring the label detectably bound to each probe of the
CC array; identifying exons in a eukaryotic genome, comprising (a)
CC algorithmically predicting at least one exon from genomic sequences of
CC the eukaryote; and (b) detecting specific hybridisation of detectably
CC labeled nucleic acids from eukaryote lung mRNA, to a single exon probe,
CC having a fragment identical to the predicted exon, the probe is included
CC in the above mentioned microarray; assigning exons to a single gene,
CC comprising (a) identifying exons from genomic sequence by the method
CC above and (b) measuring the expression of each of the exons in several
CC tissues and/or cell types using hybridisation to a single exon
CC microarrays having a probe with the exon, where a common pattern of
CC expression of the exons in the tissues and/or cell types indicates that
CC the exons should be assigned to a single gene; a peptide comprising one
CC of 12011 sequences, mentioned in the specification, or encoded by the
CC probes/open reading frames (ORF). The probes are used for gene expression
CC analysis, and for identifying exons in a gene, particularly using human
CC lung derived mRNA and for the study of lung diseases such as asthma, lung
CC cancer, chronic obstructive pulmonary disease (COPD), interstitial lung
CC disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis,
CC tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-
CC Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary
CC histiocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis,
CC Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary
CC dyskinesis, pulmonary hypertension and hyaline membrane disease. The
CC present sequence is a single exon probe of the invention. Note: The
CC sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from WIPO
CC at ftp.wipo.int/pub/published_pct_sequences

PT   New human genome-derived single exon nucleic acid probes useful for human
PT   gene expression analysis, for identifying or characterizing alternative
PT   splicing events, for assessing genomic alterations or as tools for
PT   surveying tissues.
XX
PS   Claim 1; SEQ ID NO 23983; 80pp; English.
XX
CC   The invention relates to a nucleic acid probe for measuring human gene
CC   expression, comprising any of the 27,400 fully defined nucleotide
CC   sequences in the specification, or their complements or fragments, and
CC   encoding at least 8 amino acids of any of the 6888 amino acid sequences
CC   fully defined in the specification. The probe is a single exon probe that
CC   hybridises under high stringency conditions to a nucleic acid molecule
CC   expressed in human cells or tissues. Also included are a spatially-
CC   addressable set of single exon nucleic acid probes for measuring human
CC   gene expression (comprising a plurality of single exon nucleic acid
CC   probes cited above, where each of the plurality of probes is separately
CC   and addressably isolatable or amplifiable from the plurality), a single
CC   exon microarray for measuring human gene expression, a method of
CC   measuring human gene expression, a vector comprising the single exon
CC   probe cited above, an ORF-encoded peptide comprising at least 8
CC   contiguous amino acids of any of the above- mentioned amino acid
CC   sequences (optionally with conservative amino acid substitutions), an
CC   isolated antibody that binds specifically to a peptide cited above,
CC   methods of selling and/or licensing single exon probes or microarrays to
CC   a customer desiring to measure gene expression, a method of providing
CC   human gene expression data by subscription, and a computer-readable
CC   storage medium which contains a database having a plurality of records
CC   (each record including data on the expression of a single exon probe
CC   cited above. The probe, methods and apparatus are useful in gene
CC   expression analysis. The probes may be used as tools for surveying
CC   tissues to detect the presence of expressed messages that contain their
CC   specific exon, or in constructing genome-derived single exon microarrays.
CC   In addition, the probes are used in identifying and characterising
CC   alternative splicing events, in detecting and characterising gross
CC   alterations in the genomic locus that includes their exon, in assessing
CC   smaller genomic alterations, in priming the synthesis of nucleic acids,
CC   or in expressing the ORF-encoded peptide. The present sequence is a human
CC   single exon probe of the invention. Note: The sequence data for this
CC   patent did not form part of the printed specification, but was obtained
CC   in electronic format directly from USPTO at
CC   seqdata.uspto.gov/sequence.html?DocID=20030194704

PT   New isolated nucleic acid and their fragments having the pol gene of a
PT   retrovirus, useful for diagnosing, preventing and/or treating multiple
PT   sclerosis and/or rheumatoid arthritis.
XX
PS   Disclosure; SEQ ID NO 201; 193pp; English.
XX
CC   The invention relates to an isolated nucleic acid which comprises the pol
CC   gene of a retrovirus associated with multiple sclerosis or rheumatoid
CC   arthritis. The methods and compositions of the present invention are
CC   useful for diagnosing, preventing and/or treating multiple sclerosis
CC   and/or rheumatoid arthritis. The present sequence is used in the
CC   exemplification of the invention.

XX
CC   The present sequence represents the multiple sclerosis (MS) associated
CC   retrovirus-1 (MSRV-1) pol gene region of clone 43 obtained from an MS
CC   patient 68-1. The example compares the pol regions of different clones
CC   obtained from the same patients plasma sample. The results show that the
CC   patient possesses a virion population which comprises of different MSRV
CC   variants. The invention provides complete or partial genomic sequences of
CC   the MSRV-1 pol gene, gag gene and env gene, and polypeptides encoded by
CC   these genes. The invention also provides antibodies raised against the
CC   polypeptides. The genomic sequences, polypeptides and antibodies are also
CC   claimed useful for diagnosing infection by MS and rheumatoid arthritis-
CC   associated viruses, and also for prevention and treatment of infection
CC   with these viruses

PT   New isolated or purified nucleic acid associated with multiple sclerosis
PT   and/or rheumatoid arthritis, useful for detecting a virus associated with
PT   multiple sclerosis or rheumatoid arthritis in a biological sample.
XX
PS   Example 19; Fig 50A; 193pp; English.
XX
CC   The invention relates to an isolated or purified nucleic acid from a
CC   virus associated with multiple sclerosis and/or rheumatoid arthritis,
CC   multiple sclerosis-associated virus (MSRV)-1. The nucleic acids comprise
CC   pol, gag or reverse transcriptase genes (or their fragments) encoding the
CC   proteins or defined peptides (including immunodominant peptides,
CC   antigenic peptides or conserved motifs).Also included are a process for
CC   detecting a virus associated with multiple sclerosis or rheumatoid
```

```
CC   arthritis in a biological sample, a nucleic acid probe for the detection
CC   of a virus associated with multiple sclerosis or rheumatoid arthritis, a
CC   primer for the amplification by polymerisation of a nucleic acid of a
CC   viral material associated with multiple sclerosis or rheumatoid
CC   arthritis, a polypeptide exhibiting an inhibitory activity on the
CC   proteolytic, reverse transcriptase or ribonuclease H activity from MSRV,
CC   and an antibody directed against the MSRV-1 virus obtained by
CC   immunologically reacting a human or animal body or cells with an
CC   immunogenic agent consisting of the antigenic polypeptide defined above.
CC   The nucleic acids are useful for detecting a biological sample a virus
CC   associated with multiple sclerosis or rheumatoid arthritis, or for
CC   detecting in a biological sample, the presence of or exposure to a virus
CC   associated with multiple sclerosis or rheumatoid arthritis. The present
CC   sequence is an MSRV gene, gene fragment or gene consensus sequence. Note:
CC   The SEQ ID numbers for the sequences as displayed in the main body of the
CC   patent do not match the SEQ ID numbers in the sequence listing.
CC   Consequently those sequences mentioned in the claims may not be the
CC   sequences the authors intended to claim.

PT   New isolated or purified nucleic acid associated with multiple sclerosis
PT   and/or rheumatoid arthritis, useful for detecting a virus associated with
PT   multiple sclerosis or rheumatoid arthritis in a biological sample.
XX
PS   Example 19; Fig 50A; 193pp; English.
XX
CC   The invention relates to an isolated or purified nucleic acid from a
CC   virus associated with multiple sclerosis and/or rheumatoid arthritis,
CC   multiple sclerosis-associated virus (MSRV)-1. The nucleic acids comprise
CC   pol, gag or reverse transcriptase genes (or their fragments) encoding the
CC   proteins or defined peptides (including immunodominant peptides,
CC   antigenic peptides or conserved motifs).Also included are a process for
CC   detecting a virus associated with multiple sclerosis or rheumatoid
CC   arthritis in a biological sample, a nucleic acid probe for the detection
CC   of a virus associated with multiple sclerosis or rheumatoid arthritis, a
CC   primer for the amplification by polymerisation of a nucleic acid of a
CC   viral material associated with multiple sclerosis or rheumatoid
CC   arthritis, a polypeptide exhibiting an inhibitory activity on the
CC   proteolytic, reverse transcriptase or ribonuclease H activity from MSRV,
CC   and an antibody directed against the MSRV-1 virus obtained by
CC   immunologically reacting a human or animal body or cells with an
CC   immunogenic agent consisting of the antigenic polypeptide defined above.
CC   The nucleic acids are useful for detecting a biological sample a virus
CC   associated with multiple sclerosis or rheumatoid arthritis, or for
CC   detecting in a biological sample, the presence of or exposure to a virus
CC   associated with multiple sclerosis or rheumatoid arthritis. The present
CC   sequence is an MSRV gene, gene fragment or gene consensus sequence. Note:
CC   The SEQ ID numbers for the sequences as displayed in the main body of the
CC   patent do not match the SEQ ID numbers in the sequence listing.
CC   Consequently those sequences mentioned in the claims may not be the
CC   sequences the authors intended to claim.
